NEBRASKA DEPARTMENT OF

2005 Reports & Opinions

of the

Property Tax Administrator

PROPERTY ASSESSMENT AND TAXATION

for

Thurston County 87

2005 Equalization Proceedings before the Tax Equalization and Review Commission

April 2005

Preface

Nebraska law provides the requirements for the assessment of real property for the purposes of property taxation. The Constitution of Nebraska requires that "taxes shall be levied by valuation uniform and proportionate upon all real property and franchises as defined by the Legislature except as otherwise provided in or permitted by this Constitution." Neb. Const. art. VIII, sec. 1 (1) (1998). The uniform standard for the assessed value of real property for tax purposes is actual value, which is defined by law as "the market value of real property in the ordinary course of trade." Neb. Rev. Stat. §77-112 (Reissue 2003). The assessment level for all real property, except agricultural land and horticultural land, is one hundred percent of actual value. The assessment level for agricultural land and horticultural land, hereinafter referred to as agricultural land, is eighty percent of actual value. Neb. Rev. Stat. §77-201 (1) and (2) (R.S. Supp. 2004). More importantly, for purposes of equalization, similar properties must be assessed at the same proportion of actual value when compared to each other. Achieving the constitutional requirement of proportionality ultimately ensures the balance and equity of the property tax imposed by local units of government on each parcel of real property.

The assessment process, implemented under the authority of the county assessor, seeks to value similarly classed properties at the same proportion to actual value. This is not a precise mathematical process, but instead depends on the judgment of the county assessor, based on his or her analysis of relevant factors that affect the actual value of real property. Nebraska law provides ranges of acceptable levels of value that must be met to achieve the uniform and proportionate valuation of classes and subclasses of real property in each county. Neb. Rev. Stat. §77-5023 (R.S. Supp. 2004) requires that all classes of real property, except agricultural land, be assessed between ninety-two and one hundred percent of actual value; the class of agricultural land be assessed between seventy-four and eighty percent of actual value; and, the class of agricultural land receiving special valuation be assessed between seventy-four and eighty percent of its special value and recapture value.

To ensure that the classes of real property are assessed at these required levels of actual value, the Department of Property Assessment and Taxation, hereinafter referred to as the Department, under the direction of the Property Tax Administrator, is annually responsible for analyzing and measuring the assessment performance of each county. Pursuant to Neb. Rev. Stat. §77-5027 (R.S. Supp., 2004):

[T]he Property Tax Administrator shall prepare statistical and narrative reports informing the [Tax Equalization and Review Commission] of the level of value and the quality of assessment of the classes and subclasses of real property in the state and certify his or her opinion regarding the level of value and quality of assessment in each county.

The narrative and statistical reports contained in the Reports and Opinions of the Property Tax Administrator, hereinafter referred to as the R&O, provide a thorough, concise analysis of the assessment process implemented by each county assessor to reach the levels of value and quality of assessment required by Nebraska law. The Property Tax Administrator's opinion of level of value and quality of assessment achieved by each county assessor is a conclusion based upon all

the data provided by the county assessor and gathered by the Department regarding the assessment activities during the preceding year. This is done in recognition of the fact that the measurement of assessment compliance, in terms of the concepts of actual value and uniformity and proportionality mandated by Nebraska law, requires both statistical and narrative analysis.

The Department is required by Neb. Rev. Stat. §77-1327 (Reissue 2003) to develop and maintain a state-wide sales file of all arm's length transactions. From this sales file the Department prepares an assessment sales ratio study in compliance with acceptable mass appraisal standards. The assessment sales ratio study is the primary mass appraisal performance evaluation tool. From the sales file, the Department prepares statistical analysis from a non-randomly selected set of observations, known as sales, from which inferences about the population, known as a class or subclass of real property, may be drawn. The statistical reports contained in the R&O are developed in compliance with standards developed by the International Association of Assessing Officers, hereinafter referred to as the IAAO.

However, just as the valuation of property is sometimes more art than science, a narrative analysis of assessment practices in each county is necessary to give proper context to the statistical inferences from the assessment sales ratio study. There may be instances when the analysis of assessment practices outweighs or limits the reliability of the statistical inferences of central tendency or quality measures. This may require an opinion of the level of value that is not identical to the result of the statistical calculation. The Property Tax Administrator's goal is to provide statistical and narrative analysis of the assessment level and practices to the Tax Equalization and Review Commission, hereinafter referred to as the Commission, providing the Commission with the most complete picture possible of the true level of value and quality of assessment in each county.

Finally, the Property Tax Administrator's opinions of level of value and quality of assessment are stated as a single numeric representation for level of value and a simple judgment regarding the quality of assessment practices. These opinions are made only after considering all narrative and statistical analysis provided by the county assessor and gathered by the Department. An evaluation of these opinions must only be made after considering all other information provided in the R&O.

2005 Opinions of the Property Tax Administrator for Thurston County

Pursuant to Neb. Rev. Stat. Section 77-5027 (R.S. Supp. 2004), my opinions are stated as a conclusion of the knowledge of all factors known to me based upon the assessment practices and statistical analysis for this county. While I rely primarily on the median ratio from the Qualified Statistical Reports for each class of real property, my opinion of level of value for a class of real property may be determined from other evidence contained in the Reports and Opinions. While I rely primarily on the performance standards issued by the IAAO for the quality of assessment, my opinion of quality of assessment for a class of real property may be influenced by the assessment practices of the county assessor.

Residential Real Property

It is my opinion that the level of value of the class of residential real property in Thurston County is 94% of actual value. It is my opinion that the quality of assessment for the class of residential real property in Thurston County is not in compliance with generally accepted mass appraisal practices.

Commercial Real Property

It is my opinion that the level of value of the class of commercial real property in Thurston County is 90% of actual value. It is my opinion that the quality of assessment for the class of commercial real property in Thurston County is not in compliance with generally accepted mass appraisal practices.

Agricultural Land

It is my opinion that the level of value of the class of agricultural land in Thurston County is 74% of actual value. It is my opinion that the quality of assessment for the class of agricultural land in Thurston County is in compliance with generally accepted mass appraisal practices.

Dated this 11th day of April, 2005.

Catherine D. Lang

Property Tax Administrator

Residential Real Property

I. Correlation

Thurston: RESIDENTIAL: Minimal assessment changes were done to the residential class as reported by the county for the 2005 assessment year. It is believed that the level of value is within the acceptable range. Those sales under \$10,000 have a significant impact on the coefficient of dispersion and the price related differential making both statistics outside the acceptable level.

II. Analysis of Percentage of Sales Used

This section documents the utilization of total sales compared to qualified sales in the sales file. Neb. Rev. Stat. Section 77-1327 (Reissue 2003) provides that all sales are deemed to be arm's length unless determined otherwise through a sales review conducted under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the sales file. For 2005, the Department did not review the determinations made by the county assessor for real property.

The Standard on Ratio Studies, International Association of Assessing Officials, (1999), indicates that low levels of sale utilization may indicate excessive trimming by the county assessor. Excessive trimming, the arbitrary exclusion or adjustment of arm's length transactions, may indicate an attempt to inappropriately exclude arm's length transactions to create the appearance of a higher quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of residential real property.

	2001	2002	2003	2004	2005
Total Sales	145	159	146	132	132
Qualified Sales	92	87	78	72	60
Percent Used	63.45	54.72	53.42	54.55	45.45

Thurston: RESIDENTIAL: The utilization table represents a decline in the percentage used from the previous years. However, after a review of the non qualified sales, there is nothing to indicate excessive trimming of the total sales file. The measurement of the residential class was done as fairly as possible utilizing all available sales.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio

The trended preliminary ratio is an alternative method to calculate a point estimate as an indicator of the level of value. This table compares the preliminary median ratio, trended preliminary median ratio, and R&O median ratio, presenting five years of data to reveal any trends in assessment practices. The analysis that follows compares the changes in these ratios to the assessment actions taken by the county assessor. If the county assessor's assessment practices treat all properties in the sales file and properties in the population in a similar manner, the trended preliminary ratio will correlate closely with the R&O median ratio. The following is the justification for the trended preliminary ratio:

Adjusting for Selective Reappraisal

"The reliability of sales ratio statistics depends on unsold parcels being appraised in the same manner as sold parcels. Selective reappraisal of sold parcels distorts sales ratio results, possibly rendering them useless. Equally important, selective reappraisal of sold parcels ("sales chasing") is a serious violation of basic appraisal uniformity and is highly unprofessional. Oversight agencies must be vigilant to detect the practice if it occurs and take necessary corrective action."

"[To monitor sales chasing] A preferred approach is to use only sales that occur after appraised values are determined. However, as long as values from the most recent appraisal year are used in ratio studies, this is likely to be impractical. A second approach is to use values from the previous assessment year, so that most (or all) sales in the study follow the date values were set. In this approach, measures of central tendency must be adjusted to reflect changes in value between the previous and current year. For example, assume that the measure of central tendency is 0.924 and, after excluding parcels with changes in use or physical characteristics, that the overall change in value between the previous and current assessment years is 6.3 percent. The adjusted measure of central tendency is $0.924 \times 1.063 = 0.982$. This approach can be effective in determining the level of appraisal, but measures of uniformity will be unreliable if there has been any meaningful reappraisal activity for the current year."

Gloudemans, Robert J., Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 315.

	Preliminary	% Change in Assessed	Trended Preliminary	R&O Median
	Median	Value (excl. growth)	Ratio	
2001	93	-0.06	92.94	93
2002	94	0.24	94.23	94
2003	95	-0.21	94.8	95
2004	91.76	-2.33	89.62	91.54
2005	92.68	0.62	93.26	93.71

Thurston: RESIDENTIAL: The Trended Preliminary Ratio is relatively the same as the R&O Ratio. There is no information available to suggest that the median is not the best representation of the level of value for the residential class.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value

This section analyzes the percentage change of the assessed values in the sales file, between the 2005 Preliminary Statistical Reports and the 2005 R&O Statistical Reports, to the percentage change in the assessed value of all real property, by class, reported in the 2005 County Abstract of Assessment for Real Property, Form 45, excluding growth valuation, compared to the 2004 Certificate of Taxes Levied

(CTL) Report. For purposes of calculating the percentage change in the sales file, only the sales in the most recent year of the study period are used. If assessment practices treat sold and unsold properties consistently, the percentage change in the sale file and assessed base will be similar. The analysis of this data assists in determining if the statistical representations calculated from the sales file are an accurate measure of the population. The following is justification for such an analysis:

Comparison of Average Value Changes

"If sold and unsold properties are similarly appraised, they should experience similar changes in value over time. Accordingly, it is possible to compute the average change in value over a selected period for sold and unsold parcels and, if necessary, test to determine whether observed differences are significant. If, for example, values for vacant sold parcels in an area have increased by 45 percent since the previous reappraisal, but values for vacant unsold parcels have increased only 10 percent, sold and unsold parcels appear to have not been equally appraised. This apparent disparity between the treatment of sold and unsold properties provides an initial indication of poor assessment practices and should trigger further inquiry into the reasons for the disparity."

Gloudemans, Robert J., Mass Appraisal of Real Property, (International Association of Assessing Officers, 1999), p. 311.

% Change in Total Assessed		% Change in Assessed Value
Value in the Sales File		(excl. growth)
0.1	2001	-0.06
0	2002	0
0	2003	0
-0.27	2004	-2.33
-0.89	2005	0.62

Thurston: RESIDENTIAL: The comparison of the Total Assessed Value in the Sales File and the Change in Assessed Value is relatively close and supports the assessment actions applied to the residential class for the 2005 assessment year.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios

There are three measures of central tendency calculated by the Department: median ratio, weighted mean ratio, and mean ratio. Because each measure of central tendency has its own strengths and weaknesses, the use of any statistic for equalization should be reconciled, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining Exhibit 87 - page 11

level of value for "direct" equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Because the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for "indirect" equalization; to ensure proper funding distribution of aid to political subdivisions, particularly when the distribution in part is based on the assessable value in that political subdivision, Standard on Ratio Studies, International Association of Assessing Officers, (1999). The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

	Median	Wgt. Mean	Mean
R&O Statistics	93.71	86.40	104.70

Thurston: RESIDENTIAL: Parcels selling for less than \$10,000 have a significant impact on the relationship of the median, aggregate (weighted mean) and mean analysis. With removal of those sales the measures tighten considerably. However, the median remains near the reported level further indicating the best representation of the level of value.

VI. Analysis of R&O COD and PRD

In analyzing the statistical data of assessment quality, there are two measures primarily relied upon by assessment officials. The Coefficient of Dispersion, COD, is produced to measure assessment uniformity. A low COD tends to indicate good assessment uniformity as there is a smaller "spread" or

dispersion of the ratios in the sales file. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 235-237 indicates that a COD of less than 15 suggests that there is good assessment uniformity. The IAAO has issued performance standards for major property groups:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less. Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

The Price Related Differential, PRD, is produced to measure assessment vertical uniformity (progressivity or regressivity). For example, assessments are considered regressive if high value properties are under-assessed relative to low value properties. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 239-240 indicates that a PRD of greater than 100 suggests that high value properties are relatively under-assessed. A PRD of less than 100 indicates that high value properties are relatively over-assessed. As a general rule, except for small samples, a PRD should range between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

The analysis in this section indicates whether the COD and PRD meet the performance standards described above.

	COD	PRD
R&O Statistics	32.19	121.19
Difference	17.19	18.19

Thurston: RESIDENTIAL: The coefficient of dispersion and the price related differential are above the acceptable range. Consideration given to sales less than \$10,000 would move the statistics to a tighter range, but leaves the coefficient of dispersion and the price related differential outside the acceptable level.

VII. Analysis of Change in Statistics Due to Assessor Actions

This section compares the statistical indicators from the Preliminary Statistical Reports to the same statistical indicators from the R&O Statistical Reports. The analysis that follows explains the changes in the statistical indicators in consideration of the assessment actions taken by the county assessor.

2005 Correlation Section for Thurston County

	Preliminary Statistics	R&O Statistics	Change
Number of Sales	60	60	0
Median	92.68	93.71	1.03
Wgt. Mean	86.79	86.40	-0.39
Mean	104.41	104.70	0.29
COD	32.68	32.19	-0.49
PRD	120.30	121.19	0.89
Min Sales Ratio	45.09	45.09	0
Max Sales Ratio	400.00	400.00	0

Thurston: RESIDENTIAL: Review of the sales between the Preliminary Statistics and the R & O Statistics found no change in the number of sales, the remainder of the information supports the county assessment actions for 2005.

Commerical Real Property

I. Correlation

Thurston: COMMERCIAL: Minimal assessment changes were done to the commercial class as reported by the county. There are only 12 qualified sales in the file. There were no sales in 2004. The lack of sales makes it difficult to rely on the median level of value. The coefficient of dispersion and the price related differential are also well outside the acceptable level.

II. Analysis of Percentage of Sales Used

This section documents the utilization of total sales compared to qualified sales in the sales file. Neb. Rev. Stat. Section 77-1327 (Reissue 2003) provides that all sales are deemed to be arm's length unless determined otherwise through a sales review conducted under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the sales file. For 2005, the Department did not review the determinations made by the county assessor for real property.

The Standard on Ratio Studies, International Association of Assessing Officials, (1999), indicates that low levels of sale utilization may indicate excessive trimming by the county assessor. Excessive trimming, the arbitrary exclusion or adjustment of arm's length transactions, may indicate an attempt to inappropriately exclude arm's length transactions to create the appearance of a higher quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of residential real property.

	2001	2002	2003	2004	2005
Total Sales	40	45	41	37	40
Qualified Sales	28	29	21	14	12
Percent Used	70	64.44	51.22	37.84	30

Thurston: COMMERCIAL: The utilization table represents a decline in the percentage used from the previous years. However, after a review of the non qualified sales, there is nothing to indicate excessive trimming of the total sales file. The measurement of the commercial class was done as fairly as possible utilizing all available sales.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio

The trended preliminary ratio is an alternative method to calculate a point estimate as an indicator of the level of value. This table compares the preliminary median ratio, trended preliminary median ratio, and R&O median ratio, presenting five years of data to reveal any trends in assessment practices. The analysis that follows compares the changes in these ratios to the assessment actions taken by the county assessor. If the county assessor's assessment practices treat all properties in the sales file and properties in the population in a similar manner, the trended preliminary ratio will correlate closely with the R&O median ratio. The following is the justification for the trended preliminary ratio:

Adjusting for Selective Reappraisal

"The reliability of sales ratio statistics depends on unsold parcels being appraised in the same manner as sold parcels. Selective reappraisal of sold parcels distorts sales ratio results, possibly rendering them useless. Equally important, selective reappraisal of sold parcels ("sales chasing") is a serious violation of basic appraisal uniformity and is highly unprofessional. Oversight agencies must be vigilant to detect the practice if it occurs and take necessary corrective action."

"[To monitor sales chasing] A preferred approach is to use only sales that occur after appraised values are determined. However, as long as values from the most recent appraisal year are used in ratio studies, this is likely to be impractical. A second approach is to use values from the previous assessment year, so that most (or all) sales in the study follow the date values were set. In this approach, measures of central tendency must be adjusted to reflect changes in value between the previous and current year. For example, assume that the measure of central tendency is 0.924 and, after excluding parcels with changes in use or physical characteristics, that the overall change in value between the previous and current assessment years is 6.3 percent. The adjusted measure of central tendency is $0.924 \times 1.063 = 0.982$. This approach can be effective in determining the level of appraisal, but measures of uniformity will be unreliable if there has been any meaningful reappraisal activity for the current year."

Gloudemans, Robert J., Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 315.

	Preliminary Median	% Change in Assessed Value (excl. growth)	Trended Preliminary Ratio	R&O Median
2001	94	-0.53	93.5	94
2002	94	-0.05	93.95	94
2003	96	-0.28	95.73	96
2004	96.44	-0.85	95.62	96.44
2005	92.60	2.11	94.55	90.36

Thurston: COMMERCIAL: The Trended Preliminary Ratio and the R&O Ratio are slightly different, but supports the fact that there was minimal action taken in the commercial class for the 2005 assessment year.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value

This section analyzes the percentage change of the assessed values in the sales file, between the 2005 Preliminary Statistical Reports and the 2005 R&O Statistical Reports, to the percentage change in the assessed value of all real property, by class, reported in the 2005 County Abstract of Assessment for Real Property, Form 45, excluding growth valuation, compared to the 2004 Certificate of Taxes Levied

(CTL) Report. For purposes of calculating the percentage change in the sales file, only the sales in the most recent year of the study period are used. If assessment practices treat sold and unsold properties consistently, the percentage change in the sale file and assessed base will be similar. The analysis of this data assists in determining if the statistical representations calculated from the sales file are an accurate measure of the population. The following is justification for such an analysis:

Comparison of Average Value Changes

"If sold and unsold properties are similarly appraised, they should experience similar changes in value over time. Accordingly, it is possible to compute the average change in value over a selected period for sold and unsold parcels and, if necessary, test to determine whether observed differences are significant. If, for example, values for vacant sold parcels in an area have increased by 45 percent since the previous reappraisal, but values for vacant unsold parcels have increased only 10 percent, sold and unsold parcels appear to have not been equally appraised. This apparent disparity between the treatment of sold and unsold properties provides an initial indication of poor assessment practices and should trigger further inquiry into the reasons for the disparity."

Gloudemans, Robert J., Mass Appraisal of Real Property, (International Association of Assessing Officers, 1999), p. 311.

% Change in Total Assessed		% Change in Assessed Value
Value in the Sales File		(excl. growth)
1.55	2001	-0.53
3.41	2002	2.61
0	2003	0
0	2004	-0.85
0.86	2005	2.11

Thurston: COMMERCIAL: The comparison of the Total Assessed Value in the Sales File and the Change in Assessed Value represent minimal change to the commercial class and support the assessment actions applied to the commercial class for the 2005 assessment year.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios

There are three measures of central tendency calculated by the Department: median ratio, weighted mean ratio, and mean ratio. Because each measure of central tendency has its own strengths and weaknesses, the use of any statistic for equalization should be reconciled, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining Exhibit 87 - page 17

level of value for "direct" equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Because the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for "indirect" equalization; to ensure proper funding distribution of aid to political subdivisions, particularly when the distribution in part is based on the assessable value in that political subdivision, Standard on Ratio Studies, International Association of Assessing Officers, (1999). The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

	Median	Wgt. Mean	Mean
R&O Statistics	90.36	84.98	92.34

Thurston: COMMERCIAL: The median and mean measures are relatively close and supportive of the assessment actions applied for the 2005 assessment year. The aggegrate (weighted mean) is lower than the other two and caused by a high dollar sales in the file.

VI. Analysis of R&O COD and PRD

In analyzing the statistical data of assessment quality, there are two measures primarily relied upon by assessment officials. The Coefficient of Dispersion, COD, is produced to measure assessment uniformity. A low COD tends to indicate good assessment uniformity as there is a smaller "spread" or dispersion of the ratios in the sales file. Mass Appraisal of Real Property, International Association of

Assessing Officers, (1999), pp. 235-237 indicates that a COD of less than 15 suggests that there is good assessment uniformity. The IAAO has issued performance standards for major property groups:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less. Vacant

land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

The Price Related Differential, PRD, is produced to measure assessment vertical uniformity (progressivity or regressivity). For example, assessments are considered regressive if high value properties are under-assessed relative to low value properties. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 239-240 indicates that a PRD of greater than 100 suggests that high value properties are relatively under-assessed. A PRD of less than 100 indicates that high value properties are relatively over-assessed. As a general rule, except for small samples, a PRD should range between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

The analysis in this section indicates whether the COD and PRD meet the performance standards described above.

	COD	PRD
R&O Statistics	35.18	108.67
Difference	15 18	5 67

Thurston: COMMERCIAL: The coefficient of dispersion and the price related differential are above the acceptable range.

VII. Analysis of Change in Statistics Due to Assessor Actions

This section compares the statistical indicators from the Preliminary Statistical Reports to the same statistical indicators from the R&O Statistical Reports. The analysis that follows explains the changes in the statistical indicators in consideration of the assessment actions taken by the county assessor.

	Preliminary Statistics	R&O Statistics	Change
Number of Sales	13	12	-1
Median	92.60	90.36	-2.24
Wgt. Mean	85.12	84.98	-0.14
Mean	92.39	92.34	-0.05
COD	31.72	35.18	3.46
PRD	108.55	108.67	0.12
Min Sales Ratio	35.03	35.03	0
Max Sales Ratio	207.55	207.55	0

Thurston: COMMERCIAL: There is one less sale in the file. The removal of one sale was due to the fact that the parcel was substantially changed from the time of sale and not reflective of what sold. The county made minimal changes to the commercial class for the 2005 assessment year and is represented in the table that there is minimal change between the Preliminary Statistics and the R&O Statistics.

Agricultural Land

I. Correlation

Thurston: AGRICULTURAL UNIMPROVED: The assessment actions reported by the countyis represented throughout the R&O statistics calculated for the 2005 assessment year. It is believed that the level of value is within the acceptable range as well as the coefficient of dispersion. The price related differential is outside the acceptable level.

II. Analysis of Percentage of Sales Used

This section documents the utilization of total sales compared to qualified sales in the sales file. Neb. Rev. Stat. Section 77-1327 (Reissue 2003) provides that all sales are deemed to be arm's length unless determined otherwise through a sales review conducted under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the sales file. For 2005, the Department did not review the determinations made by the county assessor for real property.

The Standard on Ratio Studies, International Association of Assessing Officials, (1999), indicates that low levels of sale utilization may indicate excessive trimming by the county assessor. Excessive trimming, the arbitrary exclusion or adjustment of arm's length transactions, may indicate an attempt to inappropriately exclude arm's length transactions to create the appearance of a higher quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of residential real property.

	2001	2002	2003	2004	2005
Total Sales	105	96	86	91	92
Qualified Sales	43	47	40	43	36
Percent Used	40.95	48.96	46.51	47.25	39.13

Thurston: AGRICULTURAL UNIMPROVED: The utilization table represents a decline in the percentage used from the previous years. However, after a review of the non qualified sales, there is nothing to indicate excessive trimming of the total sales file. The measurement of the agricultural class was done as fairly as possible utilizing all available sales.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio

The trended preliminary ratio is an alternative method to calculate a point estimate as an indicator of the level of value. This table compares the preliminary median ratio, trended preliminary median ratio, and R&O median ratio, presenting five years of data to reveal any trends in assessment practices. The analysis that follows compares the changes in these ratios to the assessment actions taken by the county assessor. If the county assessor's assessment practices treat all properties in the sales file and properties in the population in a similar manner, the trended preliminary ratio will correlate closely with the R&O median ratio. The following is the justification for the trended preliminary ratio:

Adjusting for Selective Reappraisal

"The reliability of sales ratio statistics depends on unsold parcels being appraised in the same manner as sold parcels. Selective reappraisal of sold parcels distorts sales ratio results, possibly rendering them useless. Equally important, selective reappraisal of sold parcels ("sales chasing") is a serious violation of basic appraisal uniformity and is highly unprofessional. Oversight agencies must be vigilant to detect the practice if it occurs and take necessary corrective action."

"[To monitor sales chasing] A preferred approach is to use only sales that occur after appraised values are determined. However, as long as values from the most recent appraisal year are used in ratio studies, this is likely to be impractical. A second approach is to use values from the previous assessment year, so that most (or all) sales in the study follow the date values were set. In this approach, measures of central tendency must be adjusted to reflect changes in value between the previous and current year. For example, assume that the measure of central tendency is 0.924 and, after excluding parcels with changes in use or physical characteristics, that the overall change in value between the previous and current assessment years is 6.3 percent. The adjusted measure of central tendency is $0.924 \times 1.063 = 0.982$. This approach can be effective in determining the level of appraisal, but measures of uniformity will be unreliable if there has been any meaningful reappraisal activity for the current year."

Gloudemans, Robert J., Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 315.

	Preliminary	% Change in Assessed	Trended Preliminary	R&O Median
	Median	Value (excl. growth)	Ratio	
2001	68	2.2	69.5	74
2002	70	9.57	76.7	74
2003	74	0.56	74.41	74
2004	69.18	5.98	73.31	75.01
2005	69.33	3.12	71.49	74.16

Thurston: AGRICULTURAL UNIMPROVED: The Trended Preliminary Ratio and the R&O Ratio are slightly different, but supports the assessment actions applied to the agricultural class for the 2005 assessment year.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value

This section analyzes the percentage change of the assessed values in the sales file, between the 2005 Preliminary Statistical Reports and the 2005 R&O Statistical Reports, to the percentage change in the assessed value of all real property, by class, reported in the 2005 County Abstract of Assessment for Real Property, Form 45, excluding growth valuation, compared to the 2004 Certificate of Taxes Levied

(CTL) Report. For purposes of calculating the percentage change in the sales file, only the sales in the most recent year of the study period are used. If assessment practices treat sold and unsold properties consistently, the percentage change in the sale file and assessed base will be similar. The analysis of this data assists in determining if the statistical representations calculated from the sales file are an accurate measure of the population. The following is justification for such an analysis:

Comparison of Average Value Changes

"If sold and unsold properties are similarly appraised, they should experience similar changes in value over time. Accordingly, it is possible to compute the average change in value over a selected period for sold and unsold parcels and, if necessary, test to determine whether observed differences are significant. If, for example, values for vacant sold parcels in an area have increased by 45 percent since the previous reappraisal, but values for vacant unsold parcels have increased only 10 percent, sold and unsold parcels appear to have not been equally appraised. This apparent disparity between the treatment of sold and unsold properties provides an initial indication of poor assessment practices and should trigger further inquiry into the reasons for the disparity."

Gloudemans, Robert J., Mass Appraisal of Real Property, (International Association of Assessing Officers, 1999), p. 311.

% Change in Total Assessed Value in the Sales File		% Change in Assessed Value (excl. growth)
0.94	2001	2.2
0	2002	-0.21
0	2003	1
6.73	2004	5.98
2.3	2005	3.12

Thurston: AGRICULTURAL UNIMPROVED: The comparison of the Total Assessed Value in the Sales File and the Change in Assessed Value represents a relatively close percentage change and supports the assessment actions applied to the agricultural class for the 2005 assessment year.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios

There are three measures of central tendency calculated by the Department: median ratio, weighted mean ratio, and mean ratio. Because each measure of central tendency has its own strengths and weaknesses, the use of any statistic for equalization should be reconciled, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining Exhibit 87 - page 23

level of value for "direct" equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Because the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for "indirect" equalization; to ensure proper funding distribution of aid to political subdivisions, particularly when the distribution in part is based on the assessable value in that political subdivision, Standard on Ratio Studies, International Association of Assessing Officers, (1999). The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

	Median	Wgt. Mean	Mean
R&O Statistics	74.16	70.04	75.10

Thurston: AGRICULTURAL UNIMPROVED: The median and mean measures are relatively close and supportive of the assessment actions applied for the 2005 assessment year. The aggregate (weighted mean) is lower than the other two and caused by a high dollar sales in the file.

VI. Analysis of R&O COD and PRD

In analyzing the statistical data of assessment quality, there are two measures primarily relied upon by assessment officials. The Coefficient of Dispersion, COD, is produced to measure assessment uniformity. A low COD tends to indicate good assessment uniformity as there is a smaller "spread" or dispersion of the ratios in the sales file. Mass Appraisal of Real Property, International Association of

Assessing Officers, (1999), pp. 235-237 indicates that a COD of less than 15 suggests that there is good assessment uniformity. The IAAO has issued performance standards for major property groups:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less. Vacant

land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

The Price Related Differential, PRD, is produced to measure assessment vertical uniformity (progressivity or regressivity). For example, assessments are considered regressive if high value properties are under-assessed relative to low value properties. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 239-240 indicates that a PRD of greater than 100 suggests that high value properties are relatively under-assessed. A PRD of less than 100 indicates that high value properties are relatively over-assessed. As a general rule, except for small samples, a PRD should range between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

The analysis in this section indicates whether the COD and PRD meet the performance standards described above.

	COD	PRD
R&O Statistics	17.22	107.23
Difference	0	4.23

Thurston: AGRICULTURAL UNIMPROVED: The coefficient of dispersion is well within the range, the price related differential is slightly outside the acceptable range and supports the assessment actions applied to the agricultural class for the 2005 assessment year.

VII. Analysis of Change in Statistics Due to Assessor Actions

This section compares the statistical indicators from the Preliminary Statistical Reports to the same statistical indicators from the R&O Statistical Reports. The analysis that follows explains the changes in the statistical indicators in consideration of the assessment actions taken by the county assessor.

	Preliminary Statistics	R&O Statistics	Change
Number of Sales	36	36	0
Median	69.33	74.16	4.83
Wgt. Mean	67.04	70.04	3
Mean	71.52	75.10	3.58
COD	18.12	17.22	-0.9
PRD	106.68	107.23	0.55
Min Sales Ratio	35.93	38.29	2.36
Max Sales Ratio	106.54	109.87	3.33

Thurston: AGRICULTURAL UNIMPROVED: Review between the Preliminary Statistics and the R & O Statistics revealed the same number of sales. The remainder of the changes represents and supports the assessment actions for the 2005 assessment year.

2005 Assessment Actions Report Thurston County

Residential

Thurston County reported for the 2005 assessment year no major revaluation changes to the residential class. The county has completed pick up work timely. The county is in the process of completing a major project where 36 acres was subdivided into lots and blocks which is a suburban area located next to Winnebago.

Commercial

Thurston County reported for the 2005 assessment year no major revaluation changes to the commercial class. The county has completed pick up work timely.

Agricultural

Thurston County completed an agricultural land study using an excel spreadsheet that analyzes the sales by breaking them down into land classification groups as well as market areas. The spreadsheet is utilized to determine increases in the land classification groups to achieve a uniform level of value as well as quality statistics. Through the analysis it was determined that where the land classification values would receive increases only in market area one.

Market area one indicated an increase to land classification groups ranging from one percent to thirty one percent in the irrigated class, an increase to land classification groups ranging from one percent to twenty three percent in the dryland and no increase to the grassland classification groups.

Market area two indicated no valuation change for the 2005 assessment year.

Market area three indicated no valuation change for the 2005 assessment year.

Other

Thurston County has spent many hours making the transition from Northeast Data computer vendor to MIPS. It should be noted that many hours have been spent completing the transition to assure that the files transferred correctly. The transition was unavoidable and had to be completed before the 2005 assessment information could be developed.

STATE OF NEBRASKA PLOCIFICATION STATE OF NEBRASKA PROPERTY ASSESSMENT AND TAXATION

AUG 2 5 2004

2004 PROGRESS REPORT FOR THURSTON COUNTY

NEBRASKA DEPARTMENT OF PROPERTY ASSESSMENT & TAXATION

INTRODUCTION

This plan of assessment is required by law, pursuant to section 77-1311, as amended by 2001 Neb. Laws LB170 , Section 5. It is to be submitted to the Thurston County Board of Equalization and the Department of Property Assessment & Taxation on or before September 1, 2001 and every year thereafter. The assessor shall update the plan yearly between the adoption of each five-year plan. The plan and any update shall examine the level, quality and uniformity of assessment in the County and may be derived from the Progress Report developed by Department and presented to the assessor on or before July 31.

GENERAL DESCRIPTION OF THURSTON COUNTY

Thurston County has a total count of 4050 parcels as reported on the 2004 County Abstract. Considering the problems that Thurston County had with filing the 2004 abstract, the Assessor is not sure that the parcel count is accurate. The count may not include the Trust and Allotment land parcels. The 2004 abstract information may also affect the CTL and other statistics provided to the legislature and others. The total Thurston County valuation is 272,476,137.

STAFF/TRAINING/BUDGET

The staff of the Thurston County Assessor's office consists of the Assessor, Chief Deputy, Assistant Deputy, and one full time clerk. The Assessor, Chief Deputy and Assistant Deputy all have the assessor certification. At the present time the Assessor and assistant Deputy have obtained hours for the current year. PAT classes are scheduled in the area. The Chief Deputy will attend the Assessor's workshop and PAT classes in Norfolk. With limited funds in Thurston County, there is little money available for registration, motels and travel. A private appraiser is contacted each year for mostly commercial pick up work. The assessor compiles the information and applies the values.

The 2004-2005 assessors' budget is in two parts. The general budget is \$55,292. The reappraisal budget is \$36,870. For 2004-2005, the Thurston County Board has been very supportive of the Assessor. For the 2004-2005 year, the County Board has agreed to pay the MIPS/County Solutions, LLC expenses out of the County general fund.

PUBLIC RELATIONS

The Thurston County Assessor's Office sent out public relation letters with the notice of valuation change, encouraging taxpayers to discuss the valuation process with the Assessor and staff. Farm land sales are displayed by acre amount on a bulletin board. Residential sales with pictures and small acreage sales are available in a notebook.

CADASTRAL MAPS

The cadastral maps are updated. The maps are kept current with parcel identification according to regulation 10-004.03. The accompanying page of parcel owners and legal descriptions is a part of the system for Thurston County. Ownership can be determined by locating the property record card, which contains the corresponding information. A long range goal, if budget allows, would be the replacement of these cadastral maps with new maps.

PROPERTY RECORD CARDS

The property record cards contain all information required by regulation 10-004, which includes the legal description, property owner, classification codes, and supporting documentation. The supporting documentation includes any field notes, a sketch of the property, a photograph of the property, and if agricultural land is involved, an inventory of the soil types by land use. The new and old aerial photographs of the buildings are included. The cards are in good condition and are updated and/or replaced as needed. Allotment land cards are kept in a separate file. Because of the two reservations located in Thurston County, the historical information is kept in the Assessor's office.

REPORT GENERATION

Reports are filed accurately and in a timely manner. Following is a list of the reports required and submitted by the Thurston County Assessor's Office annually.

Abstract- Reg 60-004.02- Due March 19
Personal Property Abstract- Due June 15
Certification of Values-Due August 20
School District Taxable Value Report- Due August 25
Certify Trust Owning Agland to Secretary of State-Oct 1
Five year Plan of Assessment-September 1
Levies Entered into Computer-November
Tax Roll Books- Delivered to Treasurer by November 22
Print Tax Bills for Treasurer- Deliver to Treasurer -November 22
Certificate of Taxes Levied- Due December 1
Tax List Corrections- Reg 10-002.09A
Print Notices of Valuation Change- May
Tax Payer Protest-June 1-July 25

HOMESTEAD EXEMPTIONS

Homestead exemptions are accepted and processed according to State Statute 77-3510 through 77-3528. Applications were accepted from April 1 through June 30. Approximately 219 homestead exemptions were filed in the Thurston County Assessor's Office in 2004.

PERSONAL PROPERTY

All personal property is handled according to Regulation 20. All schedules are to be filed by May 1 to be considered timely. From May 1 to July 31, all schedules received by the office receive a 10% penalty. After July 31, a 25% penalty is assessed. Reminder postcards are sent at the beginning of the personal property season, usually by February 1, and again the middle of April Advertisements are placed in the county newspapers to remind taxpayers that it is personal property filing time. Advertisements pertaining to personal property assessment are also placed on bulletin boards in area business places and on the public access television channel. The taxpayer's federal income tax depreciation schedule is used as a basis for the personal property schedule. 13AG's are received periodically throughout the year and are matched up with their corresponding schedules. 13AG's are used primarily as a system of checks and balances. However, in the near future, the office will not receive copies of the 13AG forms. The personal property abstract is due June 15.

CENTRALLY ASSESSED/RAILROAD PROPERTY

Centrally assessed values are received from the State Department of Property Assessment and Taxation around August 9. The value of this property in Thurston County for 2004 is 10,033,148. This valuation is made up of 9 public service schedules and 1 railroad schedule.

REAL PROPERTY

Real Property is updated annually through maintenance and pick-up work. In the 2004 valuation year, pick-up work was performed on approximately 300 parcels. The annual pick-up work includes properties discovered through all means available to the Assessor's staff. Annual maintenance included reviewing land use changes in three townships, drive by reviews of villages for change of use, changes in condition and new construction. The Office has a digital camera and color printer. New pictures will be taken of all the houses as each village and rural area is reviewed. Computer services are provided by N.E. Data. However, on September 1, 2004 the computer services will be cancelled. Thurston County will be provided service by MIPS/County Solutions, LLC. Some of the commercial services will be provided by an appraiser. Thurston County does not have zoning except for the villages of Pender, Walthill, and Emerson. New aerial photos of rural improvements were taken in November 2001, March and April of 2002. Thurston County will use the new aerial photos to assist in the review process.

Residential

Thurston County had started to implement a new residential and commercial computer CAMA system for the 2005 tax year. However, with a switch in computer vendors, implementation will take a longer length of time. A residential depreciation study is being conducted at the Assessor's office. Pick-up work and new construction reviews are done by the Assessor and staff.

In 2004 residential property was valued at 94% of market value in Thurston County. The COD was 39.90 and the PRD was 120.88. These measurements are not in the acceptable range. The county will try and address these issues for the 2005 tax year.

Commercial

The year of pricing for commercial property in Thurston County is 1979 with a 1983 update. The county has maintained review of this class. There is minimal commercial property with the majority being located in Pender. Thurston County has purchased a more user friendly CAMA commercial program to be implemented in the year 2005. Now that Thurston County computer services will be provided by MIPS/County Solutions, the new commercial program will be discarded and the office will need to enter the commercial data in the new system. The county plans to review the commercial properties for change of use, condition and updates.

In 2003 commercial property was valued at 96% of market value. The COD was 40.28, and the PRD was 130.90. The quality of assessment is not acceptable. The county will address these issues for the 2005 tax year.

Agricultural

Rural residences and improvements were updated in 1998 using current market driven depreciation.

Agricultural land use review has been ongoing for several years. Three townships will be reviewed in the fall of 2004, and land use is correlated with FSA maps. Thurston County has one of the oldest soil surveys in the State. The 1995 soil conversion table as directed by the Property Tax Administrator is also being used.

Agricultural land was assessed at 76% of market value in 2004. The COD was 12.63, and the POD was 101.53. All measurements are well within the acceptable limits.

SALES REVIEW

Real estate transfer statements are filed according to Reg 12-003. The completion of real estate transfers is a team effort: The Assessor, Deputy and one clerk complete the transactions. The Assessor inspects all 521's to ensure an accurate feel of the Thurston County market.

Thurston County has a good rapport with the DPAT's liaison. The Assessor's office provides computer copies of sale information. The office sends out a uniform sales verification letters to buyers and sellers. All responses are recorded in written form and maintained in a readily accessible manner. This clerk also maintains a sales book for residential, commercial and agricultural sales. All agricultural sales are compiled in a computer spreadsheet to allow for value setting according to the market. For 2004 Thurston County had three market areas based on a study of agricultural sales.

Five Year Assessment Plan

2005: With new computer system in place. Code all recreational land in the county. Code CRP land. Correct coding on rural residential and unimproved farm land. For example, the current program on an improved parcel of 80 acres is coded 01, 01, and 01.

Review crop land use in $\frac{1}{4}$ of the county. Revalue and review the towns of Emerson and Thurston. Coordinate lot value in Emerson with Dixon County Assessor and the State Assessor in Dakota County. Change from the front foot method to square foot method in valuing lots.

2006: Revalue all commercial and residential property in Pender and Rosalie. Change from the front foot method to square foot method in valuing lots. Review crop land use in $\frac{1}{2}$ of the county.

2007: Revalue all commercial and residential property in Walthill and Winnebago. Change from the front foot method to the square foot method in valuing lots. Review crop land use in ½ of the county.

2008: Revalue all commercial and residential property in Macy; change from the front foot method to square foot method in valuing lots. Review crop land use in $\frac{1}{4}$ of the county. Revalue rural residential, commercial, and ag improvements.

Assessment Procedure Manual

Thurston County has a partially completed Procedures Manual for the Assessor's office.

CONCLUSION

Thurston County is heavily impacted with the Native American population. This results in approximately 1,240 parcels of exempt properties, pertaining to the Winnebago and Omaha Indian reservations. The agricultural parcels are updated in the same manner as taxable parcels determine the amount of tax loss to the county. The exempt parcels range from Tribal Trust land to individual allotment land. Other property exempted by law includes mobile homes, HUD houses, and improvements on leased land, commercial buildings, and personal property. The County does not place a value on the previously described property unless part ownership is taxable to a non Indian... Having to list, measure and place a value on these properties would cause a budget hardship for the Assessor's Office. The County has a great number of Allotment parcels of land wherein a non Indian has inherited a fractional share of a parcel. The Assessor's office attempts to have a file of improvements owned by the Tribe or by Native Americans on exempt land.

Each year a study is done to determine if values are within range, and which types of revaluations are needed. Sales are not chased. Sales are tools to value all property in the class/sub-class. Special care is necessary to insure the integrity of the sales file so that it can remain a useful device. Good record keeping is imperative.

The Assessor has and will delegate duties to the office staff and develop their expertise in order to expand the level of knowledge in the office in anticipation of the eventual retirement of the current Assessor.

The Assessor's office will abide with the laws of the State of Nebraska pertaining to all matters in the office to the best of our ability, time, staff and budget.

Thurston County Assessor

Date this 20th of August, 2004

State of Nebraska Department of Property Assessment and Taxation

2004 Progress Report for Thurston County

Introduction

State law establishes the framework within which the assessor must operate. A real property assessment system requires that an operation or procedure be done completely and in a uniform manner each time it is completed. Accurate and efficient assessment practices represent prudent expenditure of tax monies, establish taxpayer confidence in local government, and enable the local government to serve its citizens more effectively.

Plan of Assessment

Pursuant to Neb. Rev. Stat. Section 77-1311(8), (R. S. Supp., 2003), the assessor shall submit a Plan of Assessment to the county board of equalization and the Department of Property Assessment and Taxation, hereinafter referred to as the Department, on or before September 1, 2001, and every five years thereafter. The assessor shall update the plan each year between the adoptions of each five-year plan. The plan and any update shall examine the level, quality, and uniformity of assessment in the county and may be derived from the Progress Report developed by the Department and presented to the assessor on or before July 31 each year.

Purpose of the Department's 2004 Progress Report

The Department's Progress Report shall be based on reports and statistics developed by class and subclass of real property. The intent of the Progress Report is to provide a review of the assessor's actions for residential, commercial and agricultural property classes, and how these actions affect the overall level, quality, and uniformity of assessment of the three classes and the various subclasses.

For 2004, the Progress Report will contain two elements offering assistance in the measurement of assessment practices. The first element to be developed is a section on Standards; this portion of the report will consist of a set of minimum acceptable standards against which the assessment practices of a county will be measured. The second element will consist of topic(s) that have been chosen as data gathering subjects this year, which will be used to develop standards for measurement in future years.

The Progress Report offers guidance to the assessor in the preparation and update of their 2004 Five-Year Plan. In addition, the Progress Report will offer suggestions to the assessor to assist in the planning of cyclical inspection, review and appraisal processes. Using the 2003 Five-Year Plan and statistical analysis as a guide, the Progress Report may be used by the assessor to

extend the assessor's plan over its five year projection to indicate classes and subclasses that are in need of attention or have been omitted from the previous planning process and make recommendations accordingly.

Standards

I. Sales Review Standards

The Sales Review Standards were prepared to outline the minimum acceptable effort of sale review. The purpose of sale review is to make a qualification determination about the usability of each sale for measurement purposes. More intensive review procedures for use in the assessment and appraisal process are encouraged, but not required in this standard. This process should also be systematically extended to all classes to support the qualification decision that the assessor must make for each sale. This process must be verifiable by written documentation supplied by the assessor.

There are four standards for the sales review standard:

Standard One (1): All sales shall be deemed to be arm's length transactions unless through the verification process the sale is found to be a non-arm's length transaction. (77.1327(2)

Standard Two (2): All sales involving personal property (tangible and/or intangible) and outliers (those exhibiting a fifty-percent point deviation from the top end of the acceptable range for residential and commercial properties, and those exhibiting a forty-percent point deviation from the top end of the acceptable range for agricultural unimproved) must be verified with a primary party to the sale or knowledgeable third party. The verification may be accomplished by telephone, in person, or questionnaire.

Standard Three (3): Regardless of what interview (or verification) method is used, there shall be an established or uniform set of questions used for each interview and the responses must be recorded in written form and maintained in a readily accessible manner.

Standard Four (4): Only adjustments for personal property and intangible personal property (goodwill, going-concern value, etc.) that are verified with one of the primary parties to the sale or a knowledgeable third party should be made by the assessor, with the following consideration, "If the stated value of personal property is more than 5 percent of the total sale price for residential property or more than 25 percent for commercial property, the sale should be excluded unless the sales sample is small and there is strong evidence to support the value estimate of the personal property." [The International Association of Assessing Officers, Standard on Ratio Studies, 1999.] IAAO does not address personal property adjustments in the agricultural class; therefore it is the opinion of the Department that adjustments to agricultural land sales shall be considered in the same manner as the commercial class of property.

Findings of Sales Review Standards

Standard One (1) – All sales are considered arm's length transactions. Currently the county utilizes the Sales File Practice Manual provided by the Department of Property Assessment and Taxation as a reference for completing the 521 supplemental information. Non arm's length transactions are coded with reasons listed in the 2002 Annual Course of Training, "Supplement "Green sheet" Issues", but are not limited to these reasons. If a numerical reason does not describe the situation for a non arm's length transaction, the county will document in the Assessor Comments portion of the supplemental sheet why the sale is a non arm's length transaction.

Through the review/verification of the sale the county determines if a sale was not an arm's length transaction.

Standard Two (2) – The County sends a questionnaire to the buyer and seller of the parcel of real estate or all three classes of property regardless of the indicated ratio. The verification is used to confirm the usability of the sale.

Standard Three (3) – The County has developed a one page document asking questions to verify the circumstances of the sale.

Standard Four (4) – Adjustments to the sale are rarely done in Thurston County. If an adjustment is made it is only with the proper verification to support the adjustment.

Conclusion

The review of the sales qualification and verification process was discussed with the County. It appears that Thurston County is in compliance with the Sales Review Standards.

II. Property Record Keeping Standards

Pursuant to REG-10-001.10 property record file shall mean a file that contains the property record card, worksheets, supplemental data, and transfer information. All portions of the property record file shall be interrelated through codes and references, which shall be recorded on the property record card. This may be in the form of an electronic file that can be printed on demand. The Department does not recommend a particular style for a property record file. REG-10-004 requires that every assessor shall prepare and maintain a property record file which shall include a property record card, for each parcel of real property including improvements on leased land and exempt properties, in the county.

Therefore, for the property record keeping review there are three standards:

Standard One (1): Each property record card shall contain an area for the name and address of the current owner. There shall also be an area for the documentation of ownership changes and the noting of splits or additions to the original parcel during the

past five years. 10-004.01A (3), 10-004.01A (2), and 10-004.01A (11). For the ability to locate a parcel of real property it shall be required that the legal description, situs of the property, and cadastral map or GIS reference number be a part of the record card. 10-004.01A (1), 10-004.01A (4), and 10-004.01A (5). The current property classification code shall be a part of the record card.10-004.01A (6). The record card shall show tax district information as determined by the county 10-004.01A (7). Current year and one or more prior years history of the final assessed value of land and improvements. 10-004.01A (8).

Standard Two (2): The property record file shall contain a picture of the major improvement on the improved parcels. 10-004.01B (1). A sketch of the improvement or main structures if applicable. 10-004-01B (2). A ground plan sketch or aerial photograph if there are multiple improvements in addition to the main structures if applicable. 10-004.01B (3). School district codes as prescribed by the Department of Property Assessment and Taxation. 10-004.01B (4). Four or more prior year's history of the final assessed value of land and improvements. Also a complete history of each incremental adjustment or change made within an assessment year to the assessed value of the parcel recorded in the file, including the nature of the change and an indication of assessment body or official ordering the change. 10-004.01B (5). Other codes created by the assessor that are relevant to the specific parcel, such as coded expressions for the legal description, account numbers or other identifiers. 10-004.01B (6). All information or reference to all records or working papers relevant to the valuation of the property. Examples are, but not limited to; the relevant cost tables, depreciation tables, land valuation tables, income analysis, and sales comparison analysis.

Standard Three (3): The three approaches to value are cost, income and sales comparison. The Cost Approach is the approach to value which is based upon the principle of substitution that the informed purchaser would pay no more than the cost of producing a substitute property with the same utility as the subject property. (50-001.13). The Income Approach shall mean the approach to value which converts anticipated benefits to be derived from the ownership of property into a value estimate (50-001.15). The Sales Comparison Approach shall mean a process of analyzing sales of similar recently sold properties in order to derive an indication of the most probable sales price of the property being appraised. (50-001.16). The Assessor shall make the final estimation of value, depending on one or more approaches to value, on each parcel of real property. The property record file shall contain a correlation section that summarizes the results of each approach to value that has been completed for the parcel. Also there shall be a narrative statement that provides an explanation of the correlation process and the final estimate of value. 10.004.01B (7). This final value estimate shall be consistent with the value reported on the property record card and notice of valuation change.

Findings of Property Record Keeping Standards

Standard One (1) – Thurston County meets the requirements of the property card/file minimum standard.

Standard Two (2) – Located within the property record file the working papers of the county relevant to the valuation is a summary of the land valuation, a costing sheet for the improvement, a field worksheet identifying the parcel and a drawing of the improvement.

Standard Three (3) – The County primarily uses the cost approach with market derived depreciation. Therefore, the county doesn't have a reconciliation process of each approach to value but relies on the combination of the two approaches to establish the value.

Conclusion

Review of the counties property record/files, it appears that Thurston County is in compliance with the majority of the Property Record Keeping Standard. The only area of concern would be that reference be made to the correlation of value between the cost approach and the sales comparison approach.

III. Five Year Plan of Assessment Standards

There are several key elements that must be present for the Five-Year Plan to accomplish its intended purpose. When the Department reviews the county's present plan, they will direct their suggestions toward whether the plan utilizes the statistical sections of the most current and prior Reports and Opinions to suggest priority actions to the assessor.

Since one of the most basic purposes of the Five-Year Plan is to assure that over a five year time frame that each parcel of real property in the county has been inspected, it is imperative that the plan describe a systematic and repeatable process that will take place in a five year or shorter cycle.

All classes or subclasses or parts of classes or subclasses should be covered in the plan.

For the purpose of this report, the definitions of the following terms found in REG-50-001 are applicable. Appraisal, reappraisal and mass appraisal, (paragraph 001.02), appraisal process, (paragraph 001.03), appraisal update, (paragraph 001.05), appraisal maintenance or pick-up work, (paragraph 001.06), appraisal or assessed value adjustment, (paragraph 001.22) and other terms defined or used in the Assessment Process Regulations as necessary.

The details of each assessment process should be described within a written procedures manual. An example that should be contained in a county procedures manual is the <u>Steps in a Revaluation</u> that was drawn from the textbook, Mass Appraisal of Real Property, International Association of Assessing Officers, 1999.

Steps in a Revaluation

- 1. Performance Analysis ratio study
- 2. Revaluation Decision
- 3. Analysis of Available resources
 - Staff
 - Data processing support
 - Existing system and procedures
 - Budget
- 4. Planning and organization
 - Objectives
 - Work plans and assignment of responsibilities
- 5. System acquisition or development
 - Forms, manuals, and valuation schedules
 - Software
- 6. Pilot Study
- 7. Data collection
 - Property characteristics data
 - Sales, income/expense, and cost data
- 8. Valuation
 - Initial Values
 - Testing, refinement, and final values
- 9. Value Defense
 - Informal hearing
 - Appeal boards
- 10. Final ratio study

For the five-year plan of assessment there are six standards:

Standard One (1): The plan should be formatted by year for the five years it entails and address each property class/subclass for that year.

Standard Two (2): The plan should address level of value and quality of assessment.

Standard Three (3): Budgeting, staffing, and training issues should be discussed.

Standard Four (4): There should be a time line for accomplishing goals.

Standard Five (5): Although historical information may be useful it should be kept to a minimum and not be redundant of information that may already be included in the abstract or survey; the focus should be on current and future goals.

Standard Six (6): The plan should contain detailed information on what will be required for physical inspections; anticipated number of parcels that will be done, is it done offsite, on-site, does it include interior inspections, who will do it and are they qualified, and what characteristics are they looking for. Include language in the plan as to what is

actually meant by reappraisal, update, review and so forth so it is clearly understood what is going to be done. The plan should indicate which portion of the county will be reappraised, i.e. one-fourth of the county every year, and be uniquely identified, for example by neighborhoods, assessor location, market area or, townships.

Findings of Five Year Plan of Assessment

Standard One (1) – The current plan addresses current issues and does not address a five year cycle.

Standard Two (2) – The level of value, coefficient of dispersion and price related differential are briefly mentioned for each property class.

Standard Three (3) – The plan briefly addresses the staff/training and budget.

Standard Four (4) – There is no time line for accomplishing goals.

Standard Five (5) – Descriptive information about the county characteristics are provided in the five year plan. Minimal current or future goals were addressed.

Standard Six (6) – There is not detailed information provided in the current plan

Conclusion

Review of the 2003 Five Year Plan of Assessment reveals several areas that need to be addressed more specifically. The plan fails to outline actions for specific years. The plan made minimal reference to the level of value and quality statistics. A detailed description of the assessment practice to review of properties would be beneficial. The plan should address each class and/or subclass that the county intends to visit and the timeframe expected to accomplish the tasks.

While it is difficult to plan for a five year process, this document would be used to monitor progress and completion of goals.

Informational Data

I. <u>Data Collection/Physical Characteristics (As it pertains to the appraisal process as outlined within the five-year plan of assessment.)</u>

The assessor should be able to describe their processes to collect and maintain the physical characteristics of all parcels of real property for classification, valuation, and other purposes for both land and improvements. The characteristics gathered should be based on an analysis by the assessor of the characteristics that most affect the market. These characteristics are not necessarily limited to the physical measurements of the structures.

Conclusion

The County has been in the process of sending questionnaires to the owners of the residential real property to clarify the physical characteristics of the residence. A drive-by review is part of the process to confirm the information completed on the questionnaires.

II. Assessment Procedures Manual

Although it is not specified in regulations, it is deemed to be good assessment practice to prepare a manual that specifies office and assessment procedures. This manual should contain detailed explanations of each step in the assessment processes. The procedures described must then be followed and the taxpayers may thus be assured that the county has uniform and proportionate processes used in the valuation of their property.

If the county has developed a procedures manual, is the detail sufficient to permit a reader of the manual to easily understand the assessment process in place in the county.

Are terms like appraisal, listing, verification and review defined sufficiently and used precisely enough to adequately describe the assessment processes of the county to any reader or user of the assessment procedures manual.

Conclusion

Currently the county is in the process of developing an Assessment Procedures Manual.

Purpose Statements for the 2005 Reports and Opinions

Commission Summary

Displays essential statistical information from other reports contained in the R&O. It is intended to provide an overview for the Commission, and is not intended as a substitute for the contents of the R&O.

Property Tax Administrator's Opinions

Contains the conclusions reached by the Property Tax Administrator regarding level of value and quality of assessment based on all the data provided by the county assessor and gathered by the Department regarding the assessment activities of the county.

Correlation Section

Contains the narrative analysis of the assessment actions and statistical results which may influence the determination of the level of value and quality of assessment for the three major classes of real property. This section is divided into three parts: Residential Real Property; Commercial Real Property; and, Agricultural Land. All information for a class of real property is grouped together to provide a thorough analysis of the level of value and quality of assessment for the class of real property.

Each part of the Correlation Section contains the following sub-parts:

- I. Correlation
- II. Analysis of Percentage of Sales Used
- III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratios
- IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value
- V. Analysis of the R&O Median, Weighted Mean, and Mean Ratios
- VI. Analysis of R&O COD and PRD
- VII. Analysis of Changes in the Statistics Due to the Assessor Actions

Sub-part I is the narrative conclusion of all information known to the Department regarding the class of property under analysis. Sub-parts II through VII compare important statistical indicators that the Department relies on when comparing assessment actions to statistical results and provide the explanation necessary to understand the conclusions reached in Sub-part I.

The Correlation Section also contains the 2005 County Abstract of Assessment for Real Property, Form 45, Compared with the 2004 Certificate of Taxes Levied (CTL) Report which compares data from two annual administrative reports filed by the county assessor. It compares the data from the 2004 CTL to establish the prior year's assessed valuation and compares it to the data from the 2005 County Abstract of Assessment for Real Property, Form 45, to demonstrate the annual change in assessed valuation that has occurred between assessment years. This report displays the amount of assessed dollars of change and the percentage change in

various classes and subclasses of real property. It also analyzes real property growth valuation in the county.

Statistical Reports Section

Contains the statistical reports prepared by the Department pursuant to Neb. Rev. Stat. Section 77-1327(3) (Reissue 2003) and the *Standard on Ratio Studies*, International Association of Assessing Officers, (1999). These statistical reports are the outputs of the assessment sales ratio study of the county by the Department.

The statistical reports are prepared and provided to the county assessors at least four times each year. The Department, pursuant to 350 Nebraska Administrative Code, Chapter 12, Sales File, and *Directive 04-06, Responsibilities of the County or State Assessor and the Department of Property Assessment and Taxation in the Development of the Real Property Sales File for Assessment Year 2005*, November 10, 2004, provided Draft Statistical Reports, to each county assessor on or before Monday, September 17, 2004, based on data in the sales file as of Monday, September 13, 2004, and on or before Friday, November 19, 2004, based on data in the sales file as of Wednesday, November 17, 2004. The purpose of the Draft Statistical Reports was to provide the statistical indicators of the sales in the biannual rosters that were also provided to the county assessors on the aforementioned dates.

The Department provided the 2005 Preliminary Statistical Reports to the county assessors and the Commission on or before Friday, February 4, 2005, based on data in the sales file as of **Saturday, January 15, 2005**.

The Statistical Reports Section contains statistical reports from two points in time:

R&O Statistical Reports, in which the numerator of the assessment sales ratio is the 2005 assessed valuation of the property in the sales file as of the 2005 Abstract Filing Date.

Preliminary Statistical Reports, in which the numerator of the assessment sales ratio is the final 2004 assessed value of the property in the sales file.

All statistical reports are prepared using the query process described in the Technical Specification Section of the 2005 R&O.

Assessment Actions Section

Describes practices, procedures and actions implemented by the county assessor in the assessment of real property.

County Reports Section

Contains reports from and about a county which are referenced in other sections of the R&O:

County Abstract of Assessment for Real Property, Form 45

A required administrative report filed annually with the Department by the county assessor. It is a summation of the 2005 assessed values and parcel record counts of each defined class or subclass of real property in the county and the number of acres and total assessed value by Land Capability Group (LCG) and by market area (if any).

County Agricultural Land Detail

A report prepared by the Department. The Department relies on the data submitted by the county assessor on the Abstract of Assessment of Real Property, Form 45, Schedule IX and computes by county and by market area (if any) the average assessed value of each LCG and land use.

County Abstract of Assessment for Real Property, Survey

Describes the funding and staffing of the county assessor's office.

2004 Progress Report

A report prepared by the Department and presented to the county assessor on or before July 31 of each year. This report is based on reports and statistics developed by class and subclass of real property for each county. The county assessor may utilize the Progress Report in the development and update of their Five-Year Plan of Assessment. Neb. Rev. Stat. §77-1311(8) (Reissue 2003). The Progress Report contains two sections that offer assistance in the measurement of assessment practices. The first section contains a set of minimum standards against which assessment practices of a county are measured. The second section contains two topics chosen by the Department which are practices or procedures that the Department is studying for development of future standards of measurement.

The County Assessor's Five-Year Plan of Assessment-Update

The Five-Year Plan of Assessment is prepared by the county assessor and updated annually, pursuant to Neb. Rev. Stat. §77-1311(8) (Reissue 2003). It explains the scope and detail of the assessment processes planned by the county assessor for the current and subsequent four assessment years.

Special Valuation Section

The implementation of special valuation in a county, in whole or in part, presents challenges to the measurement of level of value and quality of assessment of special value and recapture value. Special valuation is a unique assessment process that imposes an obligation upon the assessment officials to assess qualified real property at a constrained taxable value. It presents challenges to measurement officials by limiting the use of a standard tool of measurement, the assessment sales ratio study. The Purpose provides the legal and policy framework for special valuation and

describes the methodology used by the Department to measure the special value and recapture value in a county.

Special valuation is deemed implemented if the county assessor has determined that there is other than agricultural or horticultural influences on the actual value of agricultural land and has established a special value that is different than the recapture value for part or all of the agricultural land in the county. If a county has implemented special valuation, all information necessary for the measurement of agricultural land in that county will be contained in the Special Valuation Section of the Reports and Opinions of the Property Tax Administrator.

Nebraska Constitutional Provisions:

Article VIII, Section 1, subsection 1: Requires that taxes be levied by valuation uniformly and proportionately upon all real property and franchises except as provided by the constitution.

Article VIII, Section 1, subsection 4: Allows the Legislature to provide that agricultural land, as defined by the Legislature, shall constitute a separate class of property for tax purposes and may provide for a different method of taxing agricultural land which results in valuations that are not uniform and proportionate with other classes of real property but are uniform and proportionate within the class of agricultural land.

Article VIII, Section 1, subsection 5: Allows the Legislature to enact laws to provide that the value of land actively devoted to agricultural use shall for property tax purposes be that value that the land would have for agricultural use without regard to any value such land might have for other purposes and uses.

Nebraska Statutory Provisions for Agricultural Land:

77-112: Definition of actual value. Actual value of real property for purposes of taxation means the market value of real property in the ordinary course of trade. Actual value may be determined using professionally accepted mass appraisal methods, including, but not limited to, the (1) sales comparison approach using the guidelines in section 77-1371, (2) income approach, and (3) cost approach. Actual value is the most probable price expressed in terms of money that a property will bring if exposed for sale in the open market, or in an arm's length transaction, between a willing buyer and willing seller, both of whom are knowledgeable concerning all the uses of which the real property is adapted and for which the real property is capable of being used. In analyzing the uses and restrictions applicable to real property, the analysis shall include a consideration of the full description of the physical characteristics of the real property and an identification of the property rights being valued.

77-201: Property taxable; valuation; classification. (1) Except as provided in subsections (2) and (3) of this section, all real property in this state, not expressly exempt therefrom, shall be subject to taxation and shall be valued at its actual value. (2) Agricultural land and horticultural land as defined in section 77-1359 shall constitute a separate and distinct class of property for purposes of property taxation, shall be subject to taxation, unless expressly exempt from taxation, and

shall be valued at eighty percent of its actual value. (3) Agricultural land and horticultural land actively devoted to agricultural or horticultural purposes which has value for purposes other than agricultural or horticultural uses and which meets the qualifications for special valuation under section 77-1344 shall constitute a separate and distinct class of property for purposes of property taxation, shall be subject to taxation, and shall be valued for taxation at eighty percent of its special value as defined in section 77-1343 and at eighty percent of its recapture value as defined in section 77-1343 when the land is disqualified for special valuation under section 77-1347.

77-1359(1): Definition of agricultural land. Agricultural land and horticultural land shall mean land which is primarily used for the production of agricultural or horticultural products, including wasteland lying in or adjacent to and in common ownership or management with land used for the production of agricultural or horticultural products. Land retained or protected for future agricultural or horticultural uses under a conservation easement as provided in the Conservation and Preservation Easements Act shall be defined as agricultural land or horticultural land. Land enrolled in a federal or state program in which payments are received for removing such land from agricultural or horticultural production shall be defined as agricultural land or horticultural land. Land that is zoned predominantly for purposes other than agricultural or horticultural use shall not be assessed as agricultural land or horticultural land.

Nebraska Statutory Provisions for Special Valuation:

77-1343(5): Definition of recapture valuation. Recapture valuation means the actual value of the land pursuant to section 77-112.

77-1343(6): Definition of special valuation. Special valuation means the value that the land would have for agricultural or horticultural purposes or uses without regard to the actual value the land would have for other purposes or uses.

Nebraska Statutory Provisions for Measurement of Level of Value:

77-1327(4): For purposes of determining the level of value of agricultural and horticultural land subject to special valuation under sections 77-1343 to 77-1348, the Property Tax Administrator shall annually make and issue a comprehensive study developed in compliance with professionally accepted mass apprais al techniques to establish the level of value if in his or her opinion the level of value cannot be developed through the use of the comprehensive assessment ratio studies developed in subsection (3) of this section.

Discussion of the Constitutional and Statutory Provisions:

Nebraska law requires that all values of real property for tax purposes shall be uniform and proportionate. Agricultural land may be treated differently from other real property for tax purposes, but the assessed values shall be uniform and proportionate within the class of agricultural land. Additionally, agricultural land may be valued for tax purposes at its value solely for agricultural use without regard to the value the land might have for any other purpose and use; however, these values must be uniform and proportionate within the application of this constitutional provision.

Nebraska's statutory structure for the valuation of agricultural land is fairly straightforward. The valuation policy is based on actual or market value. Actual value is a common, market standard that is used to determine the value of a property for many purposes, including taxation. Actual value is also a measure that is governed by practices and principles familiar to most people. Additionally, using actual value as the standard by which to determine valuation of real property provides the property owner with the ability to judge the proportionality of the valuation with other like property or other classes of property.

Discussion of Special Valuation:

The policy of special valuation was developed as the conversion of agricultural land to other uses demanded action for two purposes: one, the systematic and planned growth and development near and around urban areas; and two, to provide a tax incentive to keep agricultural uses in place until the governing body was ready for the growth and development of the land. Special value is both a land management tool and a tax incentive for compliance with the governing body's land management needs. As alternative, more intensive land uses put pressure for the conversion of underdeveloped land, economic pressures for higher and more intensive uses from non-agricultural development provide economic incentives to landowners to sell or convert their land. Governments, in order to provide for the orderly and efficient expansion of their duties, may place restrictions on landowners who convert land from one land use to a higher more intensive land use. Additionally, the existing landowners who may wish to continue their agricultural operations have an incentive to continue those practices until the governing body is ready for the conversion of their property to a more intensive use.

Without special valuation, existing agricultural landowners in these higher intensive use areas would be forced to convert their land for tax purposes, as the market value of the land could be far greater than its value for agricultural purposes and uses. The history of special valuation would indicate that the other purposes and uses are those not normally or readily known within the agricultural sector and are more intensive, requiring the greater need for governmental services, such as residential, recreational, commercial or industrial development.

There are two scenarios that exist when special valuation is implemented in a county:

One, special valuation is applicable in a defined area of the county or only for certain types of land in the county. In these situations the county has found that use of the land for non-agricultural purposes and uses influences the actual value of some of the agricultural land in the county. In these situations, the Department must measure the level of value of agricultural land, special value, and recapture value. If the methodology of the assessor states that the assessor used sales of similar land that are not influenced by the non-agricultural purposes and uses of the land, then the sales of uninfluenced land are used to determine the special valuation of the influenced land. The sales of agricultural land that are not influenced by the non-agricultural purposes and uses are used to measure the level of value of uninfluenced agricultural land.

Two, special valuation is applicable in the entire county. In this situation the county has found that the actual value of land for other purposes and uses other than agricultural purposes and uses influences the actual value of <u>all of the agricultural land</u> in the county. In these situations, the Department must measure the level of value of special value and recapture value.

Measurement of Special Valuation

The Department has two options in measuring the level of value of special valuation. In a county where special valuation is not applicable in the entire county and the land that is subject to special value is similar to agricultural land that is not subject to special value, the Department can analyze the level of value outside the special valuation area and determine if the level of value in that area should be deemed to be the level of value for special valuation. If the land in the special value area is dissimilar to other agricultural land in the county so there is no comparability of properties, the Department would analyze the valuations applicable for special value to determine if they correlate with the valuations in other parts of the county, even though direct comparability may not exist.

In a county where the special valuation is applicable throughout the entire county, the Department has developed an income based measurement methodology which does not rely on the sales of agricultural land in the county. In developing this methodology, the Department considered all possible mass appraisal techniques. There is, however, no generally accepted approach for the measurement of constrained values. For example, the assessment/sales ratio study measures influences of the "whole" market. In counties where there are nonagricultural influences throughout the county, there are no sales in that county without a nonagricultural influence on value. As a result, the Department had to examine and adapt professionally accepted mass appraisal techniques to the measurement of special valuation other than the assessment sales ratio. As the Department analyzed the three professionally accepted mass appraisal techniques relating to the valuation of real property, the Department discarded the use of the cost approach as not being suited to the analysis of unimproved agricultural land. With respect to the sales comparison approach, in counties that are 100 percent special valuation, any sales data would have to be "surrogate" sales from other counties where nonagricultural influences have no impact on sales of agricultural land. This analysis would provide a significant level of subjectivity in terms of whether the counties from which the surrogate sales are drawn are truly comparable to the county that is being measured. The Department ultimately chose to adapt the income approach to this process. First, the income approach could rely on income data from the county being measured. Second, the Department could, to some degree, reduce the subjectivity of the process because nonagricultural influences do not influence the cash rent that land used for agricultural purposes commands in the market place.

Rent Data

For purposes of determining the income for the Department's measurement technique, the Department gathered cash rent data for agricultural land. There were three sources for cash rent data. One, the annual study done by the University of Nebraska, Lincoln, titled *Nebraska Farm Real Estate Market Developments 2003-2004*. Two, the Board of Educational Lands and Funds

(BELF), which provides a statewide schedule of crop land rental rates and grass land rental rates. The databases provided by BELF contained a summary presentation of all of the rental contracts that were examined by county, parcel size, land use, contract rent, BELF rent estimate and classification and notes relating to lease conditions. This data was provided for both cropland and grassland. Three, the annual survey entitled *Farm and Ranch Managers Cash Rental Rate Survey*, which is provided to the Department from BELF.

Gross rental amounts are used in the Department's methodology because the marketplace tends to take expenses and taxes (items that must be accounted for in any income approach to value) into account in the determination of the amount the lessee will pay the lessor for the rental of agricultural land.

Rate Data

The second portion of the income methodology is the development of a "rate". The Department sought to correlate the available data and determine a single rate for each major land use. By doing this, the final values which were developed as a standard for comparison with the special valuation varied by county based on the rent estimates that were made. The calculation for the rate was done in several steps. First, the abstract of assessment was used to determine the assessed valuation for each land classification group for the counties not using special valuation that were comparable to the special valuation counties. Second, that assessed valuation was divided by the level of value for agricultural land as determined by the Tax Equalization and Review Commission to reach 100% of the value of agricultural land without nonagricultural influences. In turn, the Department took the rent estimates for each LCG in those counties and multiplied them by the number of acres in that LCG to generate total income. That amount was then divided by the total value of agricultural land to determine a rate for that county. The rates for the comparable counties were then arrayed, in a manner similar to assessment/sales ratios. In developing the rates, a starting point was the use of "comparable" counties to those using special valuation.

The Department looked to counties where there was not an active process of special valuation in place or unrecognized nonagricultural influences. Additionally, the Department looked to comparable counties in the proximity of the counties being measured. The most significant group was the 12 counties that were geographically adjacent to the eight special valuation counties. Further, the Department looked at the distribution of land uses in the comparable counties and whether they were similar to those in the subject counties. The Department then sorted counties and rates based on land use mix. As the Department worked through the process, land use mix tended to drive the analysis. The eight primary special valuation counties were all strongly weighted toward dryland, measuring 66.6% to 82.8% dryland use. In analyzing the counties in the eastern part of the state, a mean and median rate was calculated based on the proportion of land use. For the counties with 65% and greater dryland use, the mean rates were between 6.07% and 6.20% and the median rates were between 6.27% and 6.42%. The Department's correlation process resulted in a rate of 6.25% to apply to the dryland rents to convert them to value.

A similar process was done for grassland and the Department determined the rate to be 4.25%. For the eight primary special valuation counties, grassland use varied between approximately 5 and 22%. Therefore, the rate determined by the Department was based on the rates calculated for counties with similar percentages of grassland use.

The Department had the most difficulty with a rate for irrigated land. In analyzing the uninfluenced counties, irrigated use had the greatest "spread" in calculated rates. Additionally, some of the counties where irrigated land rates were developed had agricultural land with little similarity to the special valuation counties. The Department finally chose the counties with the most similarity to those being measured and developed a rate of 8.25%.

Valuation Calculation

The applicable rates were applied to the rental income for each land use multiplied by the number of acres for that use. The result of this calculation was to reach total special valuation, which represents of the value for agricultural purposes only.

Measurement Calculation

Lastly, to calculate the level of value achieve by a county, the Department takes value calculated from the income approach which represents the total special valuation for a county and compares it to the amount of special valuation provided by the county on its annual abstract of assessment to reach the estimated level of value for special valuation in each subject county.

Measurement of Recapture Valuation

The measurement of recapture valuation is accomplished by using the Department's sales file and conducting a ratio study using the recapture value instead of the assessed or special value in making the comparison to selling price. The Department has the capability of providing statistical reports utilizing all agricultural sales or utilizing only the sales that have occurred with recapture valuation stated by the assessor on the sales file record.

Measurement of Agricultural Land Valuation

In a county where special valuation is not applicable in the entire county, the Department must measure the level of value of the agricultural land valuation. This is accomplished by using part of the agricultural land sales file using sales that are not in the area where special valuation is available. Other than using only the applicable part of the sales file, this is the same measurement process that is used by the Department for agricultural land in a county that has no other purposes and uses for its agricultural land.

Purpose Statements Section

Describes the contents and purpose of each section in the Reports and Opinions.

Glossary

Contains the definitions of terms used throughout the Reports and Opinions.

Technical Specifications Section

Contains the calculations used to prepare the Commission Summary, the Correlation Section tables, the Statistical Reports Query, and the Statistical Reports.

Certification

Sets forth to whom, how and when copies of the Reports and Opinions are distributed.

Map Section

The Map section contains a collection of maps that the Property Tax Administrator has gathered that pertain to each county. These maps may be used as a supplement to the Reports and Opinions of the Property Tax Administrator.

History Valuation Charts Section

The History Valuation chart section contains four charts for each county. The charts display taxable valuations by property class and subclass, annual percentage change, cumulative percentage change, and the rate of annual percent change over the time period of 1992 to 2004.

Glossary

Actual Value: the market value of real property in the ordinary course of trade. Actual value may be determined using professionally accepted mass appraisal methods, including, but not limited to, (1) sales comparison approach using the guidelines in Neb. Rev. Stat. §77-1371 (Reissue 2003), (2) income approach, and (3) cost approach. Actual value is the most probable price expressed in terms of money that a property will bring if exposed for sale in the open market, or in an arm's length transaction, between a willing buyer and willing seller, both of whom are knowledgeable concerning all the uses of which the real property is adapted and for which the real property is capable of being used. In analyzing the uses and restrictions applicable to real property, the analysis shall include a consideration of the full description of the physical characteristics of the real property and an identification of the property rights being valued.

Adjusted Sale Price: a sale price that is the result of adjustments made to the purchase price reported on the Real Estate Transfer Statement, Form 521, for the affects of personal property or financing included in the reported purchase price. If the sale price is adjusted, it is the adjusted sale price that will be used as the denominator in the assessment sales ratio. While an adjustment for time is listed as an allowable adjustment, the Department does not adjust selling prices for time under its current practices.

Agricultural Land: land that is agricultural land and horticultural land as defined in Neb. Rev. Stat. §77-1343(1) (R. S. Supp., 2004) and Neb. Rev. Stat. §77-1359(1) (Reissue 2003).

Agricultural Land Market Areas: areas with defined characteristics within which similar agricultural land is effectively competitive in the minds of buyers and sellers with other comparable agricultural land in the area within a county. These areas are defined by the county assessor.

Agricultural Property Classification: includes all properties in the state-wide sales file with Property Classification Code: Property parcel type-05 Agricultural, all Statuses. A subclassification is defined for the Status-2: unimproved agricultural properties (see, Agricultural Unimproved Property Classification).

Agricultural Unimproved Property Classification: includes all properties in the state-wide sales file with Property Classification Code: Property parcel type-05 Agricultural, Status-2.

Arm's Length Transaction: a sale between two or more parties, each seeking to maximize their positions from the transaction. All sales are deemed to be arm's length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques.

Assessed Value: the value of a parcel of real property established by a government that will be the basis for levying a property tax. In Nebraska, the assessed value of a parcel of real property is first established by the county assessor of each county. For purposes of the Department's sales file, the assessed value displays the value for land, improvements and total. The assessed value is the numerator in the assessment sales ratio.

Assessment: the official act of the county assessor to discover, list, value, and determine the taxability of all parcels of real property in a county.

Assessment Level: the legal requirement for the assessed value of all parcels of real property. In Nebraska, the assessment level for the classes of residential and commercial real property is one hundred percent of actual value; the assessment level for the class of agricultural and horticultural land is 80% of actual value; and, the assessment level for agricultural land receiving special valuation is 80% of special value and recapture value.

Assessment Sales Ratio: the ratio that is the result of the assessed value divided by the sale price, or adjusted sale price, of a parcel of real property that has sold within the study period of the state-wide sales file.

Assessor Location: categories in the state-wide sales file which are defined by the county assessor to represent a class or subclass of property that is not required by statute or regulation. Assessor location allows the county assessor to further sub-stratify the sales in the state-wide sales file.

Average Absolute Deviation (AVG.ABS.DEV.): the arithmetic mean of the total absolute deviations from a measure of central tendency such as the median. It is used in calculating the coefficient of dispersion (COD).

Average Assessed Value: the value that is the result of the total assessed value of all sold properties in the sample data set divided by the total of the number of sales in the sample data set.

Average Selling Price: the value that is the result of the total sale prices of all properties in the sample data set divided by the total of the number of sales in the sample data set.

Central Tendency, Measure of: a single point in a range of observations, around which the observations tend to cluster. The three most commonly used measures of central tendency calculated by the Department are the median ratio, weighted mean ratio and mean ratio.

Coefficient of Dispersion (COD): a measure of assessment uniformity. It is the average absolute deviation calculated about the median expressed as a percentage of the median.

Coefficient of Variation (COV): the measure of the relative dispersion of the sample data set about the mean. It is the standard deviation expressed in terms of a percentage of the mean.

Commercial Property Classification: includes all properties in the state-wide sales file with Property Classification Code: Property parcel type-02 Multi-Family, all Statuses; Property parcel type 03-Commercial, all Statuses; and, Property parcel type 04-Industrial, all Statuses.

Confidence Interval (CI): a calculated range of values in which the measure of central tendency of the sales is expected to fall. The Department has calculated confidence intervals around all three measures of central tendency.

Confidence Level: the required degree of confidence in a confidence interval commonly stated as 90, 95, or 99 percent. For example, a 95 percent confidence interval would mean that one can be 95% confident that the measure of central tendency used in the interval falls within the indicated range.

Direct Equalization: the process of adjusting the assessed values of parcels of real property, usually by class or subclass, using adjustment factors or percentages, to achieve proportionate valuations among the classes or subclasses.

Equalization: the process to ensure that all locally assessed real property and all centrally assessed real property is assessed at or near the same level of value as required by law.

Geo Code: each township represented by a state-wide unique sequential four-digit number starting with the township in the most northeast corner of the state in Boyd County going west to the northwest corner of the state in Sioux County and then proceeding south one township and going east again, until ending at the township in the southwest corner of the state in Dundy County.

Growth Value: is reported by the county assessor on the Abstract of Assessment for Real Property, Form 45. Growth value includes all increases in valuation due to improvements of real properties as a result of new construction, improvements, and additions to existing buildings. Growth value does not include a change in the value of a class or subclass of real property as a result of the revaluation of existing parcels, the value changes resulting from a change in use of the parcel, or taxable value added because a parcel has changed status from exempt to taxable. There is no growth value for agricultural land.

Indirect Equalization: the process of computing hypothetical values that represent the best estimate of the total taxable value available at the prescribed assessment level. Usually a function used to ensure the proper distribution of intergovernmental transfer payments between state and local governments, such as state aid to education.

Level of Value: the level of value is the level achieved by the county assessor for a class or subclass of centrally assessed property. The Property Tax Administrator is annually required to give an opinion of the level of value achieved by each county assessor to the Tax Equalization and Review Commission. The acceptable range for levels of value for classes of real property are provided in Neb. Rev. Stat. §77-5023 (3) (R.S. Supp., 2004).

Location: the portion of the Property Classification Code that describes the physical situs of the real property by one of the following descriptions:

- 1-Urban, a parcel of real property located within the limits of an incorporated city or village.
- 2-Suburban, a parcel of real property located outside the limits of an incorporated city or village, but within the legal jurisdiction of an incorporated city or village.
- 3-Rural, a parcel of real property located outside an urban or suburban area, or located in an unincorporated village or subdivision which is outside the legal jurisdiction of an incorporated city or village.

Majority Land Use: the number of acres compared to total acres by land use for agricultural land. The thresholds used by the Department are: 95%, 80% and 50%. If "N/A" appears next to any category it means there are "other" land classifications included within this majority grouping.

Maximum Ratio: the largest ratio occurring in the arrayed sample data set.

Mean Ratio: the ratio that is the result of the total of all assessment/sales ratios in the sample data set divided by the number of ratios in the sample data set.

Median Ratio: the middle ratio of the arrayed sample data set. If there is an even number of ratios, the median is the average of the two middle ratios.

Minimally Improved Agricultural Land: a statistical report that uses the sales file data for all sales of parcels classified as Property Classification Code: Property parcel type–05 Agricultural, which have non-agricultural land and/or improvements of minimal value, the assessed value is determined to be less than \$10,000 and less than 5% of the selling price.

Minimum Ratio: the smallest ratio occurring in the arrayed sample data set.

Non-Agricultural Land: for purposes of the County Abstract of Assessment for Real Property, Form 45, land located on a parcel that is classified as Property Classification Code: Property parcel type-05 Agricultural, which is not defined as agricultural and horticultural land, pursuant to Neb. Rev. Stat. §77-1359 (Reissue 2003).

Number of Sales: the total number of sales contained in the sales file that occurred within the applicable Sale Date Range for the class of real property.

Population: the set of data from which a statistical sample is taken. In assessment, the population is all parcels of real property within a defined class or subclass in the county.

Price Related Differential (PRD): a measure of assessment vertical uniformity (progressivity or regressivity). It measures the relative treatment of properties based upon the selling price of the properties. It is calculated by dividing the mean ratio by the weighted mean ratio.

Property Classification Code: a code that is required on the property record card of all parcels of real property in a county. The Property Classification Code enables the stratification of real property into classes and subclasses of real property within each county. The classification code is a series of numbers which is defined in Title 350, Nebraska Administrative Code, ch.10-004.02.

Property Parcel Type: the portion of the Property Classification Code that indicates the predominant use of the parcel as determined by the county assessor. The Property parcel types are:

- 01-Single Family Residential
- 02-Multi-Family Residential
- 03-Commercial
- 04-Industrial
- 05-Agricultural
- 06-Recreational
- 07-Mobile Home
- 08-Minerals, Non-Producing
- 09-Minerals, Producing
- 10-State Centrally Assessed
- 11-Exempt
- 12-Game and Parks

Purchase Price: the actual amount, expressed in terms of money, paid for a good or service by a willing buyer. This is the amount reported on the Real Estate Transfer Statement, Form 521, Line 22.

Qualified Sale: a sale which is an arm's length transaction included in the state-wide sales file. The determination of the qualification of the sale may be made by the county assessor or the Department.

Qualitative Statistics: statistics which assist in the evaluation of assessment practices, such as the coefficient of dispersion (COD) and the price related differential (PRD).

Quality of Assessment: the quality of assessment achieved by the county assessor for a class or subclass of real property. The Property Tax Administrator is annually required to give an opinion of the quality of assessment achieved by each county assessor to the Commission.

Recapture Value: for agricultural and horticultural land receiving special valuation, the assessed value of the land if the land becomes disqualified from special valuation. Recapture value means the actual value of the land pursuant to Neb. Rev. Stat. §77-112 (Reissue 2003). Special value land is valued for taxation at 80% of its recapture value, if recapture is triggered.

Residential Property Classification: includes all properties in the state-wide sales file with Property Classification Code: Property parcel type-01 Single Family, all Statuses; Property parcel type-06 Recreational, all Statuses; and, Property parcel type-07 Mobile Home, Statuses 1 and 3.

Sale: all transactions of real property for which the Real Estate Transfer Statement, Form 521, is filed and with stated consideration of more than one hundred dollars or upon which more than one dollar and seventy-five cents of documentary stamp taxes are paid.

Sale Date Range: the range of sale dates reported on Real Estate Transfer Statements, Form 521, that are included in the sales assessment ratio study for each class of real property.

Sale Price: the actual amount, expressed in terms of money, received for a unit of goods or services, whether or not established in a free and open market. The sale price may be an indicator of actual value of a parcel of real property. An estimate of the sales price may be made from the amount of Documentary Stamp Tax reported on the Real Estate Transfer Statement, Form 521, as the amount recorded on the deed. The sale price is part of the denominator in the assessment sales ratio.

Sample Data Set: a set of observations selected from a population.

Special Value: for agricultural and horticultural land receiving special valuation, the assessed value of the land if the land is qualified for special valuation. Special value means the value that the land has for agricultural or horticultural purposes or uses without regard to the actual value that land has for other purposes and uses. Special value land is valued for taxation at 80% of its special value.

Standard Deviation (STD): the measure of the extent of the absolute difference of the sample data set around the mean. This calculation is the first step in calculating the coefficient of variation (COV). It assumes a normalized distribution of data, and therefore is not relied on heavily in the analysis of assessment practices.

Statistics: numerical descriptive data calculated from a sample, for example the median, mean or COD. Statistics are used to estimate corresponding measures for the population.

Status: the portion of the Property Classification Code that describes the status of a parcel:

- 1-Improved, land upon which buildings are located.
- 2-Unimproved, land without buildings or structures.
- 3-Improvement on leased land (IOLL), any item of real property which is located on land owned by a person other than the owner of the item.

Total Assessed Value: the sum of all the assessed values in the sample data set.

Total Sale Price: the sum of all the sale prices in the sample data set. If the selling price of a sale was adjusted for qualification, then the adjusted selling price would be used.

Usability: the coding for the treatment of a sale in the state-wide sales file database.

- 1-use the sale without adjustment
- 2-use the sale with an adjustment
- 4-exclude the sale

Valuation: process or act to determine the assessed value of all parcels of real property in the county each year.

Weighted Mean Ratio: the ratio that is the result of the total of all assessed values of all properties in the sample data set divided by the total of all sale prices of all properties in the sample data set.

Commission Summary Calculations

For all classes of real property

For Statistical Header Information and History: see Statistical Calculations

For Residential Real Property

% of value of this class of all real property value in the county:

Statistical Reports Query

The Statistical Reports contained in the Reports and Opinions for each county derive from the sales file of the Department of Property Assessment and Taxation. The sales file contains all recorded real property transactions with a stated consideration of more than one-hundred dollars (\$100) or upon which more than one dollar and seventy-five cents (\$1.75) in documentary stamp taxes are paid as shown on the Real Estate Transfer Statement, Form 521. Transactions meeting these criteria are considered sales.

The first query performed by the sales file is by county number. For each of the following property classifications, the sales file performs the following queries:

Residential:

Property Class Code: Property Type 01, all Statuses

Property Type 06, all Statuses

Property Type 07, Statuses 1 and 3

Sale Date Range: July 1, 2002 through June 30, 2004

Qualified: All sales with Assessor Usability Code: blank, zero, 1 or 2.

If blank or zero will be considered a Usability of 1.

Commercial:

Property Class Code: Property Type 02, all Statuses

Property Type 03, all Statuses Property Type 04, all Statuses

Sale Date Range: July 1, 2001 through June 30, 2004

Qualified: All sales with Department Usability Code: zero, 1 or 2

If blank or zero will be considered a Usability of 1.

Unimproved Agricultural:

Property Class Code: Property Type 05, Status 2

Sale Date Range: July 1, 2001 through June 30, 2004

Qualified: All sales with Department Usability Code: zero, 1 or 2.

If blank or zero will be considered a Usability of 1.

Minimally Improved Agricultural: (Optional)

Property Class Code: Property Type 05, All Statuses Sale Date Range: July 1, 2001 through June 30, 2004

Qualified: All sales with Department Usability Code: zero, 1 or 2.

If blank or zero will be considered a Usability of 1.

Once a record is deemed qualified agricultural, the program will determine: If the current year assessed value improvement plus the non-agricultural total value is less than 5% and \$10,000 of the Total Adjusted Selling Price, the record will be deemed Minimally

Improved.

Coding Information & Calculations

Each sale in the sales file becomes a record in the sales file program. All statistical calculations performed by the sales file program round results in the following manner: if the result is not a whole number, then the program will round the result five places past the decimal and truncate to the second place past the decimal. Sales price and assessed value are whole numbers.

Number of Sales

- Coded as Count, Character, 5-digit field.
- The Count is the total number of sales in the sales file based upon the selection of Total or Qualified. For purposes of this document, Qualified and Sale Date Range is assumed.

Total Sales Price

- Coded as TotSalePrice, Character, 15-digit field.
- The Total Sales Price is based on the Total Sale Amount, shown on Line 24 of the Real Estate Transfer Statement, Form 521, for each record added together.
- Calculation
 - o Sum SaleAmt

Total Adj. Sales Price

- Coded as TotAdjSalePrice, Character, 15-digit field.
- The Total Adjusted Sale's Price is the Total Sale Amount for each record plus or minus any adjustments made to the sale by the county assessor, Department or the Commission (from an appeal).
- Calculation
 - Sum SaleAmt + or Adjustment s

Total Assessed Value

- Coded as TotAssdValue, Character, 15-digit field.
- The Total Assessed Value is based on the Entered Total Current Year Assessed Value Amount for each record. If the record is an agricultural record, Property Classification Code: Property Parcel Type-05, then the Total Assessed Value is the Entered Current Year Total Value adjusted by any value for Non-Ag Total and Current Year Total Improvements, so that the Total Assessed Value used in the calculations for these records is the assessed value for the agricultural land only.
- Calculation
 - o Sum TotAssdValue

Avg. Adj. Sales Price

- Coded as AvgAdjSalePrice, Character, 15-digit field.
- The Average Adjusted Sale Price is dependant on the TotAdjSalePrice and the Count defined above.
- Calculation
 - o TotAdjSalePrice/Count

Avg. Assessed Value

- Coded as AvgAssdValue, Character, 15-digit field.
- The Average Assessed Value is dependant on the TotAssdValue and the Count defined above.
- Calculation
 - o TotAssdValue/Count

Median

- Coded as Median, Character, 12-digit field.
- The Median ratio is the middle ratio when the records are arrayed in order of magnitude by ratio.
 - o If there is an odd number of records in the array, the median ratio is the middle ratio of the array.
 - o If there is an even number of records in the array, the median ratio is the average of the two middle ratios of the array.
- Calculation
 - o Array the records by order of the magnitude of the ratio from high to low
 - o Divide the Total Count in the array by 2 equals Record Total
 - o If the Total Count in the array is odd:
 - Count down the number of whole records that is the Record Total + 1. The ratio for that record will be the Median ratio
 - o If the Total Count in the array is even:
 - Count down the number of records that is Record Total. This is ratio 1.
 - Count down the number of records that is Records Total + 1. That is ratio 2.
 - (ratio 1 + ratio 2)/2 equals the Median ratio.

Weighted Mean

- Coded as Aggreg, Character, 12-digit field.
- Calculation
 - o (TotAssdValue/TotAdjSalePrice)*100

Mean

- Coded Mean, Character, 12-digit field
- Mean ratio is dependant on TotalRatio which is the sum of all ratios in the sample.
- Calculation
 - o TotalRatio/RecCount

COD

- Coded COD, Character, 12-digit field
- Calculation
 - Subtract the Median from Each Ratio
 - o Take the Absolute Value of the Calculated Differences
 - o Sum the Absolute Differences
 - o Divide by the Number of Ratios to obtain the "Average Absolute Deviation"
 - o Divide by the Median
 - o Multiply by 100

PRD

- Coded PRD, Character, 12-digit field
- Calculation
 - o (MeanRatio/AggregRatio)*100

COV

- Coded COV, Character, 12-digit field
- Calculation
 - Subtract the Mean from each ratio
 - o Square the Calculated difference
 - o Sum the squared differences
 - o Divide the number of ratios less one to obtain the Variance of the ratios
 - o Compute the Squared Root to obtain the Standard Deviation
 - o Divide the Standard Deviation by the Mean
 - o Multiply by 100

STD

- Coded StdDev, Character, 12-digit field
- Calculation
 - o Subtract the Mean Ratio from each ratio
 - o Square the resulting difference
 - o Sum the squared difference
 - o Divide the number of ratios less one to obtain the Variance of the ratios
 - o Compute the squared root of the variance to obtain the Standard Deviation

Avg. Abs. Dev.

- Coded AvgABSDev, Character, 12-digit field
- Calculation
 - o Subtracting the Median ratio from each ratio
 - o Summing the absolute values of the computed difference
 - o Dividing the summed value by the number of ratios

Max Sales Ratio

- Coded Max, Character, 12-digit field
- The Maximum ratio is the largest ratio when the records are arrayed in order of magnitude of ratio.

Min Sales Ratio

- Coded Min, Character, 12-digit field
- The Minimum ratio is the smallest ratio when the records are arrayed in order of magnitude of ratio.

95% Median C.I.

- Coded MedianConfInterval, Character, 12-digit field
- The Median Confidence Interval is found by arraying the ratios and identifying the ranks of the ratios corresponding to the Lower and Upper Confidence Limits. The equation for the

number of ratios (j), that one must count up or down from the median to find the Lower and Upper Confidence Limits is:

- Calculation
 - o If the number of ratios is Odd
 - i = 1.96xvn/2
 - o If the number of ratios is Even
 - j = 1.96xvn/2 + 0.5
 - o Keep in mind if the calculation has anything past the decimal, it will be rounded to the next whole number and the benefit of the doubt is given
 - o If the sample size is 5 or less, then N/A is given as the confidence interval
 - o If the sample size is 6-8, then the Min and Max is the given range

95% Wgt. Mean C.I.

- Coded AggregConfInterval, Character, 12-digit field
- Calculation
 - o Items needed for this calculation
 - Number of sales
 - Assessed Values Individual and Summed
 - Assessed Values Squared Individual and Summed
 - Average Assessed Value
 - Sale Prices Individual and Summed
 - Sales Prices Squared Individual and Summed
 - Average Sale Price
 - Assessed Values x Sale Prices Individual and Summed
 - The Weighted Mean
 - The t value for the sample size
 - o The actual calculation:

$$v S A^2 - 2(A/S) S (A x S) + (A/S)^2 (S S^2)$$
 $v S A^2 - 2(A/S) S (A x S) + (A/S)^2 (S S^2)$
 $v S A^2 - 2(A/S) S (A x S) + (A/S)^2 (S S^2)$
 $v S A^2 - 2(A/S) S (A x S) + (A/S)^2 (S S^2)$

o If the sample size is 5 or less, then N/A is given as the confidence interval

95% Mean C.I.

- Coded MeanConfInterval, Character, 12-digit field
- The Mean Confidence Interval is based on the assumption of a normal distribution and can be affected by outliers.
- Calculation
 - Lower Limit
 - The Mean ((t-value * The Standard Deviation)/the Square Root of the Number of Records)
 - o Upper Limit
 - The Mean + ((t-value * The Standard Deviation)/the Square Root of the Number of Records)
 - o If the number of records is > 30, then use 1.96 as the t-value
 - o If the number of records is <= 30, then a "Critical Values of t" Table is used based on sample size. Degrees of freedom = sample size minus 1
 - o If the sample is 1 or less, then N/A is given as the confidence interval

Ratio Formulas

- Residential and Commercial Records
 - o If the Assessed Value Total Equals Zero, the system changes the Assessed Value to \$1.00 for the ratio calculations. It does not make the change to the actual data.
 - o If the Sale Amount is Less Than \$100.00 AND the Adjustment Amount is Zero. The system derives an Adjustment Amount based upon the Doc Stamp fee (Doc Stamp Fee/.00175).
 - o Ratio Formula is: (Assessed Value Total/(Sale Amount + Adjustment Amount))*100.

• Agricultural Records

- o If the Sale Amount is Less Than \$100.00 AND the Adjustment Amount is Zero. The system derives an Adjustment Amount based upon the Doc Stamp fee (Doc Stamp Fee/.00175).
- o If the Sale Amount Assessed Improvements Amount Entered Non-Ag Amount + Adjustment Amount = 0. The system adds \$1.00 to the Adjustment Amount.
- o If the Assessed Land Amount Entered Non-Ag Amount Equals Zero. The system adds \$1.00 to the Assessed Land Amount.
- o Ratio Formula is:
 - a. If No Greenbelt: (Agland Total Amount)/(Sale Amount Assessed Improvements Entered NonAg Amount + Adjustment Amount))*100.
 - b. If Greenbelt: (Recapture Amount/(Sale Amount Assessed Improvements Amount Entered NonAg Amount + Adjustment Amount))*100.

Map Source Documentation

Specific maps displayed for each county will vary depending on availability. Each map contains a legend which describes the information contained on the map.

School District Map: Compiled and edited by the Nebraska Department of Education. The map has been altered by the Department of Property Assessment and Taxation to reflect current base school districts.

Market Area Map: Information obtained from the county assessor. Compiled and edited by the staff of the Tech Support Division of the Department of Property Assessment and Taxation.

Registered Wells Map: Obtained from the Nebraska Department of Natural Resources website.

GeoCode Map: Compiled and edited by the staff of the Tech Support Division of the Department of Property Assessment and Taxation.

Sections, Towns, Rivers & Streams, Topography, and Soil Class Map: Obtained from the Nebraska Department of Natural Resources website.

Assessor Location/Neighborhood Maps: Information obtained from the county assessor. Compiled and edited by the staff of the Tech Support Division of the Department of Property Assessment and Taxation.

History Valuation Chart Specifics

EXHIBITS 1B - 93B History Charts for Real Property Valuations 1992 - 2004

There are four history charts for each county. The charts display taxable valuations by property class and subclass, annual percentage change, cumulative percentage change, and the rate of annual percent change over the time period of 1992 to 2004.

Specifically:

Chart 1 (Page 1) Real Property Valuations - Cumulative %Change 1992-2004

Certification

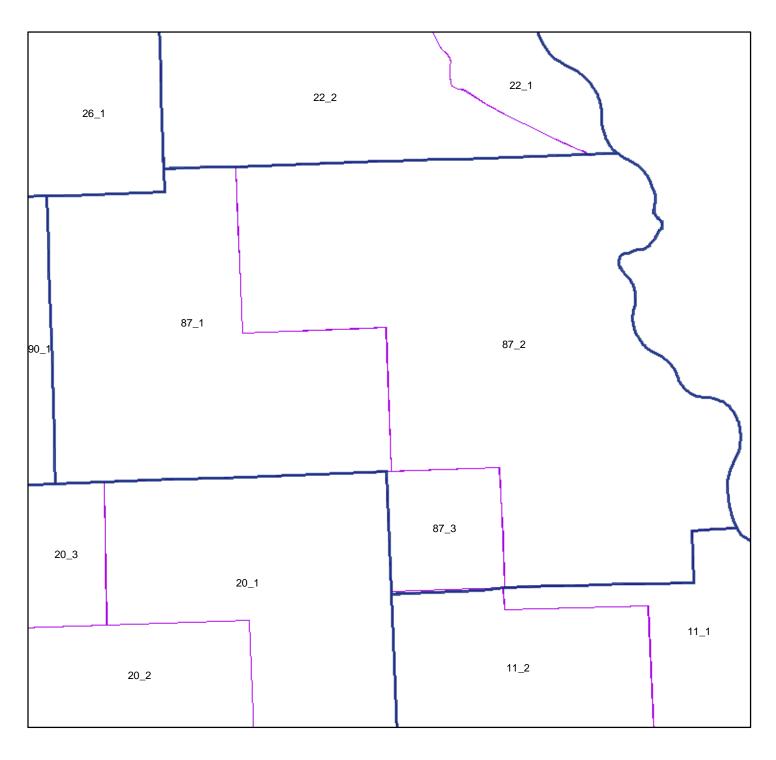

This is to certify that the 2005 Reports and Opinions of the Property Tax Administrator have been sent to the following:

- •Five copies to the Tax Equalization and Review Commission, by hand delivery.
- •One copy to the Thurston County Assessor, by certified mail, return receipt requested, 7004 1350 0002 0889 1671.

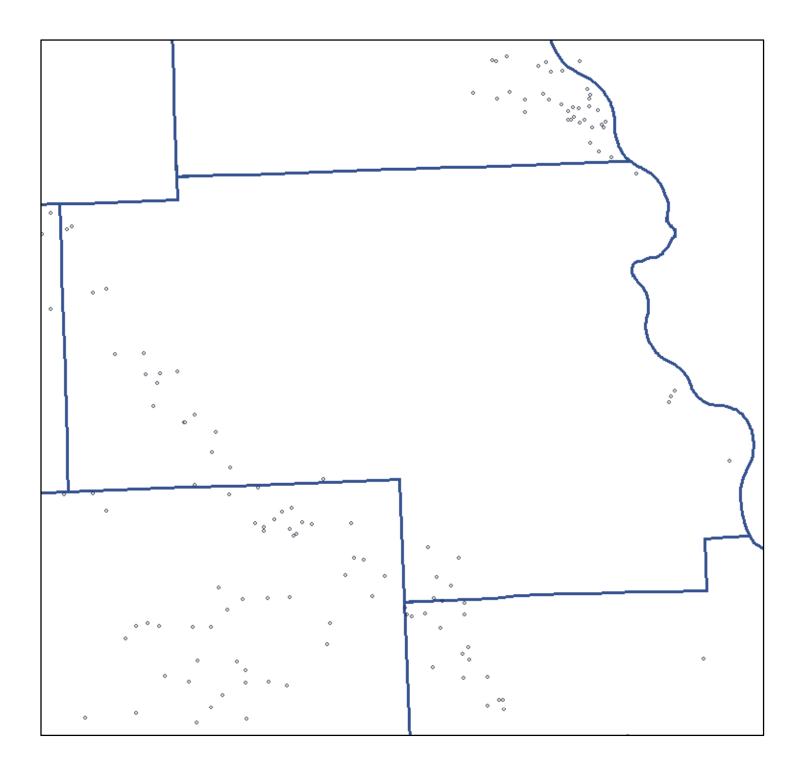

Dated this 11th day of April, 2005.
